Well, now that we've heard from the Marxist contingent... That's right, just outlaw EVERYTHING. Rescind the First Amendment because it allows dangerous ideas to spread. Get rid of the fourth, fifth, and sixth because they just protect criminals. Scrap the tenth because Washington knows what's best for you. Oh, yes, we'll be saving lives, of course. Just like all those lives saved by mandatory airbags, right? Roughly 5% of the numbers promised, and at the cost of how many people killed or injured by the bags themselves? Oh yes, don't forget the high school shootings, where 17 laws already on the books were vioated, but if we add more laws, that'll give 'em pause. Oh, and I guess we should ban scanners and even ham radios, because they're just used for crimes and conspiracies. That's right, people are stupid cattle who must have every aspect of their lives controlled by those more wise than them. Hey, DJ, any time you want to put your money where your mouth is, I'll pay for a one-way ticket to Cuba, contingent on you destroying your US passport, renouncing your citizenship, and asking Fidel for political asylum once you arrive.

Answers - in no particular order:-

It gets the aerial away from a HUGE source of interference.

It gets the aerial as high as possible.

It is safer in a pedestrian accident.

A 'bee-sting' is not so easily vandalised.

It puts some form of ground plane near the aerial which improves it's efficiency on VHF.

Most modern 'bee-sting' aerials fitted at the back have an in-built VHF amp, and losses at MF/LF are low, so cable length is not a problem.

Most non-British manufacturers fit roof antennae, front or back, or in the door pillar. It is only British tradition that puts many on the front wing.

You know...after reading this thread a while there is one point that no one has brought up.
I don't drive because of a visual disability. However, when my mother went to take her
driving test, they were kind enough to provide an italian interpreter that helped her pass the
test. The one thing he stressed to her was, Both hands on the wheel at all times.
Even though I was young at the time, the driver's manual stated that when operating a
motor vehicle, BOTH HANDS MUST BE ON THE WHEEL AT ALL TIMES
WHEN THE VEHICLE IS IN MOTION. It would be interesting to see what driver manuals
around the USA say about this today. I'm sure they would say the same thing.

How many people have actually re-read the driver's ed manual since getting their license?

It is my opinion however, that when driving, your attention should be on the road and no place else.
As a child, I was always taught not to distract the driver. Even today, when boarding a bus, right
up front there is a placard that says "Please Do Not Talk To Driver".

I remember a time when there were no cellphones, and pagers were only for doctors/fire personel.
I've heard people say, "I can't live without my cellphone." Truth is, you can.
Something to think about.

3738. Re: Cellular Telephone Antenna Patches

Newsgroup: rec.radio.scanner
Date: 1999-09-09 00:00:00 UTC
From: brint corb <bcorb@alum.mit.edu>
Message-ID: <7r92om$e0c$1@nntp5.atl.mindspring.net>
Source record: 107456
Cross-posted to: alt.cellular,alt.cellular.motorola,alt.cellular.tech,alt.cellular-phone-tech,rec.radio.scanner,rec.radio.swap

I have measured the antenna performance using a power meter at 800 and 1800 MHz using just about every antenna you can imagine in a car.

"db" is relative of course. The reference signal strength is inside an auto, a 0.6 watt nokia 6160 on tdma digital, lo and hi band, this has a built in 1/8 wave and no ground plane. The auto is in a slightly hilly area, in a valley. The signal source is a cell tower at a 10 degree azimuth from horizon.

Passive internal patch antennas (no wires): 0db ----worthless
Passive thru glass repeater (no wires): 1db --only if within 1 ft of repeater wires.
Patch internal low band antennas, wired: 1.5db (average loop plane angle)
Patch internal dual band antennas, wired: 1.5db
Typical radioshack or cheapo 3db or 5db dipole: 2db
Pro quality 1/4 wavelength dipole: 3db
Pro quality Dipole, 5/8-coilbalance-1/4 wavelength: 5db
Pro quality "dualband": 5db

The patch antennas are VERY SENSITIVE to the type of glass it is put on and location relative to other metal in the car. These are basically loop type antennas and very dirrectional response (a dipole mounted vertically is not directional on the plane of the horizon, but is on its azimuth).

The pro quality were all made by antenna specialists, ASPDM types. These use double shielded rg58 coax. probably a big difference right there.

These numbers will change depending on transmission wavelength, location of auto, type of auto, glass (tinted!?), location of antenna, cell tower azimuthal angle.

the gain figures in the ads refer to a source that is low on horizon. . if you get a source higher on horizon, you will find the 3db advertised antenna works better than the 5 db advertised unit.

>His question was, what are the specs on the patch antenna's? The patch antenna's
>that I have access to, come in both unity and 3db gain. As far as performance, I

Jason,

No alpha tags on the BC 895XLT.

You can get software to display alpha tags on your PC however.

WinScan by Pozilla Software is a good program for this.

That may be fine in theory, but breaks down quite quickly.

First off, handicapped people can't drive because they can't comply?

Driving this way is EXTREMELY tiring. Are you saying it's better to be
tired?

I've been on a race track at times in my life. You'd better believe
I had both hands on the wheel as much as possible. Or are you saying
they should ticket anyone who drives a standard shift? OPPS, Sorry,
you took your hands off the wheel to shift. You fail your drivers test!

Yes, for maximum control, this is what you would do, and a student
should use everything to there best benefit. But if this is so hard and
fast a rule as you imply, why when I took pilot training I got in
trouble
if I brought my second hand onto the wheel?

Another case of trying to make a 'one size fits all' declaration. Total
nonsense.

Mike

Just use Outlook Express. It should probably fit most of your needs, and
comes free when you upgrade to Explorer 5 (also free).

>

Well, I can tell you that most if not all airlines have such concerns about Joe Six Pack hearing them. Southwest Airlines and America West both permit scanner use inflight and United Airlines goes one step further, piping in the ATC traffic on one of the music channels in the armrest.

Further, despite claims of anyone else on the group, I have both A. never been denied permission to use the scanner inflight and B. been told by numerous pilots, both private and commercial, that a scanner in the aircraft causing harmful interference is preposterous. A TRANSMITTER would raise all sorts of havoc, yes, but my scanner's teeny little 10 mhz local oscillator is nothing to worry about.

The officer who warned me about my scanner was an L.A. County Sheriff's deputy.

I lived in Rosamond at the time which sits just north of the LA/Kern county border. I'm not sure about Kern county - I never did get a straight answer on it. Since my father in law is an active CSU member (civilian volunteer) with them, well, not to stir up controversy about them, but let's just say they had no problem "bending the rules" for members of his family at times. Basically the answer I got from the deputies there was "Phil, I don't care... go ahead." So I don't know if they restrict it or not. A HAM operator who runs the little comm shop up there says they do, but rarely enforce it unless you make an absolute pest of yourself.

Actually, I think Jake is a private pilot, so maybe it really is his airplane.

Even so, I've spoken with many pilots both private and commercial who say a scanner endangering a flight is utter nonsense.

I have yet to hear one pilot agree that a scanner on a plane is dangerous. I'm no expert, but these people are - at least the FAA thinks so....

How about it? Is there any REAL pilots out there who disagree with the dozen or so that I have personally spoken to? I sit next to one here at work (private pilot), I'm sure he'd be happy to share his opinion on this. He's one of the ones who said scanners in flight are harmless.

Mike,

I bought two BC245XLT's at the same time (one for my father).
After I programmed mine, I successfully cloned his. You'll need
a null modem (Radio Shack P/N 26-264B ~$5) and a DB-9 M-M
gender changer (also available at RS but I already had one).
Using the supplied cables, connect the null modem and gender
changer. Follow the instructions on how to make one radio the
master and one the clone. The bank indicator bar will step slowly
across the display, giving you an idea of the progress of the transfer.
Takes about a minute. Works great.

From: Bill <grayw@cvn.net>
Message-ID: <37d87e0e@news.desupernet.net>
Source record: 107489

Greetings,

I have a Yupiteru MVT-7200 that my girlfriend in Japan gave me for my
birthday. Only problem is that the manual is entirely in Japanese, so I
don't have everything figured out in the way of features / capabilities.

What I need is a manual written in English, or any tips you can provide me
with.

Also, I'd like any information on modifications that you might have for this
radio. As it stands, I can only get some of the 800 Mhz trunked
frequencies.

If anyone is interested, I have pictures taken at the '99 Yokohama, Japan
JARL Hamfest.

In Adavance, thanks.

THE MAN wrote:
>
> Eric Jorgensen wrote:
> >
> > Because it looks really *dumb* sticking up through the dashboard.

> A very scientific answer

Ask a silly question . . . . .

The reasons are all pretty obvious.

A: Distance from eletrical noise. Your ignition system, dash board gadgets, etc, all emit RFI.

B: Aesthetics. I went into this in more detail earlier.

C: Elevation. The higher the antenna, the better.

D: Not all of them are way out on the trunk, I wouldn't even venture to say half of them are way out on the trunk.

The antenna on my Geo sticks up out of the corner of the roof where it meets the driver's side door and windsheild. It looks dumb, but an 89 spectrum always looks dumb, especially one that's fondly refered to as "The Scab" - This location is very common on compact cars, and is about as close to the dash board as you're likely to get without mounting the antenna front and center infront of the windsheild.

The antenna on my Fiat Spider is mounted way out on the rear fender, and looks rather fetching there if i do say so myself. *much* better than the ones I've seen mounted in the corner of the hood on the passenger side.

The antenna on almost any truck is mounted in one of the corners of the hood near the dash. This is pretty close to the dash, probably 3 feet tops of coax to the stereo. Ditto for vans.

So, What can i say, having been confused by your question, since it's entirely nonsensical from my experience, I thought i gave an appropriate answer.

Sure, from an entirely theoretical viewpoint, the antenna should be sticking right out of the reciever. That is, given clean-room conceptual thinking, presupposing there is no rfi anywhere near the reciever, and that the reciever is properly elevated above the ground, and there are no RF blocking obstructions near the reciever.

Unfortunately, the reciever is not properly elevated and free of obstruction, and RFI is a cold fact of electrical engineering on a budget.

Maybe you should write the major auto makers and suggest they embed the stereo in the celing of the car and provide a PL239 connector on the roof?

First off, not all antenna's are 3db. You can have them from untiy gain to 5 db if you so desire.
His question was, what are the specs on the patch antenna's? The patch antenna's that I have access to, come in both unity and 3db gain. As far as performance, I don't think they would benefit a portable all that much. I've never installed those type of antenna's, so I can't give you an honest opinion. If you decide to go with one, go with the 3db gain.

Ham Radio Station For Sale:

Yaesu FT-900AT (100 Khz - 30 Mhz Receive; 1.8 - 30 Mhz Transmit)
Astron RS-35A Power Supply (13.8 Volts/35 Amps)
Yaesu Quick Release Bracket (MMB-67 I think)
Yaesu Separation Kit YSK-900
Yaesu SP-7 mobile speaker
Yaesu FIF-232C Computer Interface
Heil Proset HC-5
Headphone Mic Adapter Cable
Bencher Chrome Iambic Paddle BY-2 with Gold Contacts
Outbacker Perth mobile antenna (80 meters - 10 meters)
B & W Low Pass Filter
80 Meter Whip

AOR AR 8000 (continuous coverage from 100 Khz to 2 Ghz; 1000 Memory
Channels)
Optoelectronics Optolink Computer Interface
Cable wired for Mac
Computer Control Software for Scanner and a MacIntosh Computer

Asking $2400. But, please make an offer if interested.

Will trade for the following package:
Yeasu FT-100
Yeasu FP-1030A (power supply)
Yeasu FTS-27 (tone board)
Yeasu FC-20 (antenna tuner)
Yeasu ATAS-100 (mobile antenna)

The ones without cell phones are more than likely paying attention
unless their doing their make-up, hair, reading, etc.
I see idiots talking on their phone AND waving their other hand around
at the same time quite often. NO HANDS ON THE WHEEL FOLKS.
Ticket ALL those who do these things.

Oh c'mon! Quite a different senerio don't you think?
I'll take the cops statistics and the EMT's on what causes more
accidents, they have first hand knowledge. They see it EVERYday.

How many times have you seen on the news for instance something like
this:

A study was done and researchers found that smoking does not cause
lung cancer. Then at the end of the report the big surprise....

"The study was done by the American tobacco association".

I've heard the same thing about coffee, certain meats, etc.,etc.....

You should NOT be getting any "static." Static is a problem found in AM transmission, not FM that the Police & Fire use. Of course, it is hard to describe a sound or noise, but static is like you hear on an AM broadcast radio during an electrical storm. Does both the dispatcher & agency use the same frequency or does the base station rebroadcast the cars? If the latter, it could be that they are transmitting "their" problem in receiving. There would not be anything you could do about that! That's my 2 cents worth.

As a fulltime paramedic for nearly 15 years (now retired due to medical problems) I rarely had a problem with bystanders, as long as they stayed at a safe distance and didn't get in the way. If fact, I never had a "real" bystander cause a problem, but I did have to get a few news photographers moved because their TV lights were blinding us. Usually a quick request was met with excellent cooperation from the media.
Getting back to the true bystanders you have to remember that these are the folks who are likely to vote "yes" for the next tax increase so your department can buy a new fire engine. Let them see what their hard earned money is being used for.

If those 300,000 people had a rifle or other suitable weapon to pick up I wonder if they had been moved so easily. Kinda hard to make 300,000 people do something they don't want to when they are similarly armed to the aggressors. Boy am I glad we have a second amnedment in the USA to prevent this kind of thing from happening here.....Wait a second......Nah the second amendment is an outdated piece of the constitution that has no purpose in this day and age.

It's not a data skip at all. It causes the scanner to skip channels with
no modulation. The scanner will still stop on data channels.

PRODIGY BUSY SIGNALS (off topic)

This is a little off topic, but since we are all internet users, I thought I would let you know of a problem with PRODIGY INTERNET.

Prodigy has OVERSOLD its ability to provide service to customers in a dozen or more states. (To get a listing, call 800/213-0992 and select option 3).

As a result, current users receive endless BUSY SIGNALS when attempting to connect and bogus error messages if they are lucky enough to get through.

You would think Prodigy would have learned something from the AOL debacle of a few years ago, but apparently the quest for the dollar cancels any moral obligation to take care of current customers.

So, if you were thinking of switching to Prodigy, THINK AGAIN.

Source record: 107563

bobby4a7vv@aol.comdex (Bobby4a7vv) asked:
> Does anyone know how a new newsgroup gets "started".

The procedure is spelled out in the FAQs:
news.announce.newgroups: How_to_Create_a_New_Usenet_Newsgroup
alt.config: So_You_Want_to_Create_an_Alt_Newsgroup
These are regularly posted and are also available from:
ftp://rtfm.mit.edu/pub/usenet/news.announce.newusers

The procedure begins with an RFD (Request for Discussion), posted to news.announce.newgroups, news.groups, and any other groups related to the proposed topic. Once the discussion period is complete, a CFV (Call for Votes) is issued and an independent judge tallys the result. Initiation of an .alt group is somewhat simpler. In either case, the approved group is activated by the sending of a newgroup message.

Yep, and the studies that say using a cell phone poses no hazard to
driving is probably funded by the cell phone industry.

The bad thing about "local ordinances" as these are called, is that they often neglect to consider, or even outright deliberately ignore, state or federal laws that might say otherwise. You'd be surprised to learn how many cities don't understand (or care about, in some cases) the order of "precedence." They think they can make any law they want, even if it is the reverse of a federal law, because they believe that the city has that "right." I actually ran into this once, in Ocean City, NJ back about 88. They tried to confiscate my scanner, and would hear nothing I had to say regarding what the _state_ law said in contradiction to thier local city law, where the state allowed licensed hams to have scanners while mobile. I demanded the Super come and pull the state statutes book out of his trunk, and taught them the order of things (federal -> state -> local precedence of things; which takes precedence over which). (I don't recommend anyone ELSE try what I did, though. What I did was daring to say the least. 8-) I got some looks

from them like they thought I was trying to pull the wool over thier eyes; but after looking it up in the books, they gave it back alright, but advised me to try to keep it out of sight, thereafter. 8-))

The laws have since changed there, I understand now.

Also, from county to county, or city to city, the "exemptions" may vary.

Todd

I would guess that most car manufacturers are more into aesthetics than radio performance when it comes to locating the antenna. As long as the radio works reasonably well... Presumably the best place, technically, to mount the antenna would be in the center of the roof, but how often do we see that?!? Kinda ugly spot, really...

You are MUCH to late.....
they put it off the server weks ago when they realized that there was left an
older version of airnav where an patch works with.....
You can d/l a new demoversion from several sites. Only 3rd of the three files is
differerent.....
so look for "an31a3.zip". Current version is "an31d3.zip" as far as I know.
"an31a1.zip" and "an31a2.zip" are still the same - ...I believe :-))

1. They arrive AFTER the accident is over.

2. Each public safety worker only sees a small sample of all the accidents that occur, and their individual opinions are based on that, not on an organized compilation of any significant sampling.

3. They are trained to deal with the aftermath, and gather forensic evidence regarding individual incidents, not to analyze causal trends.

No doubt, and the 'study' claiming a hazard from cell phones was done by insurance companies looking for another attribute to tie higher premiums to. One of the central elements of the scientific method is objectivity, and it includes numerous methods to remove the bias of the investigator from the results. Just because there are those who abuse it does not invalidate it. Actually, it is the ignorance of people like JJ that allows tobacco companies et al, to promulgate the junk science they do, because the public just hears the word study, like in this cell phone issue, and accepts it as gospel, without one wit of critical evaluation, because they wouldn't know how to evaluate it even if they cared to.

I never said I disagreed with it, per se. I think idiots are a hazard in and of themselves, and cell phones do little, if anything to increment the threat they pose. Let's make a law, then, mandating the execution of everyone below an IQ of 110; that would go over well. My point was that while you, JJ, and I might believe a hazard exists, and might cite very compelling reasons for our belief, that does not establish it as fact, and thus does not justify a law which controls the behavior of others to serve our, however well supported, opinions. I believe JJ's promotion of knee jerk unscientific thinking is a hazard to the development of society, and I can support that contention, but I'm not asking Congress to enact that into a law stripping his First Amendment rights. JJ would have us outlaw an activity based on his personal opinion combined with his mindless repetition of it, complete with the same misspellings over and over. If you think that's a sound basis for legislation, then cell phones on the highway are the least of your problems.

There are no such studies, and none that say they pose a hazard, at least not valid ones. There is one 'pseudo-study' implying a possible hazard, and it's done by the insurance industry, who are only looking for another factor in people's lives they can call a hazard and apply a surcharge to.

> Tben you are a responsible cell phone user, a rarity.

Based on your contention that cell phones are proven to unavoidably create a hazard, he must be a figment of someone's imagination, then. And you want to penalize him along with the idiots. See the problem? Idiots, not cell phones, are the hazard. Or to twist a popular bumper sticker, phones don't kill, (stupid) people do. As Eric pointed out, and as my original post that got you going also asserted, an idiot, on a cell phone or not, will exhibit certain driving behaviors that are the real hazard and that ARE ALREADY ILLEGAL! Enforce the laws on the books rather than writing new ones. Question, if the idiot on the cell phone is all over the road, cutting people off, etc., and not getting ticketed now, what on earth makes you think the cop is going to notice the little three inch long phone held to his ear, and nail him for that?

> happen.

And what about the person in a shouting match with a spouse, boy/girl friend, boss, client, parent, small child etc. in the car with them? Why don't we outlaw all vehicles capable of carrying more than one person? At least with the phone, one has the option of hanging up on the nagging spouse and concentrating on driving the car. If they're in the car with you, you can't shut them up.
Rather than outlaw every innocent activity based on someone's OPINION that it is an inherent hazard, target the obvious behavior where it has been established as FACT that it puts drivers at risk. We don't need more laws.

Got a scanner? Need frequencies? ScanSearch is your answer!

Our service is simple, effective, and best of all, CHEEP.

Why spend up to $20.00 for those books when all you need is a listing for your city or county?

$5.00 gets you a very complete listing for any state, any county, all services!

Information includes:

Transmitter City
Transmitter County
Service Name
Licence City
Frequency
Licence Expire Date
Zip Code
Licence Name
Long. & Lat.
Transmitter Elevation

and more in any order you want and fast next day turn-around. Guarenteed up-to-date (we update out listings every month).

Send $5.00 cash or money order (sorry, no checks) along with what you want on your list to:

ScanSearch
115 Saint Paul Church Road
Lawndale, NC 28090

NOTE: Make money orders payable to David Westphalen

Satisfaction guarenteed or your next listing is FREE!!!

Theory may not say that, but experience proves that less IS better.
We all know about cable loss, blah, blah, blah...
Antenna on the rear for just a rcv'r doesn't matter much. But tranceiver is more critical as far as loss and swr.
For a transmitter, less IS better. Especially when using RG58, yuck.

OK, JJ, your relentless, mindless repetition has won me over. Saying it over and over again makes it right. From this day forward, I will support a law banning ANYTHING that inspires you and your little friends to flip their middle finger at someone, since, in your infinite and incessantly repeated wisdom, that is the soundest criteria for determining what causes a hazard. Hence forth, I will also adopt the spelling "dosen't" rather than "doesn't" since your consistency in that has also convinced me that the rest of the English speaking world must be wrong, based entirely on your willingness to parrot your version over and over again.
One question, though - in your first paragraph, you say it's your opinion and the opinion of many others. It can't be both a fact AND an opinion. Surely, the great, infallible JJ couldn't have made a mistake. Oh, I see - you just have to make several more posts repeating that a fact and an opinion are one and the same, using the exact same wording and creative spelling each time, and that will make it so, resolving the apparent paradox. Silly me, to have doubted you for a moment there.

I sure would like to move to wherever you live because here in NE Ohio people on their cell phones become so engrossed in their conversations they are completely oblivious to what is in front, behind or on either side of them. Just last night in front of my house a kid yakking on his phone rear ended a bus that had stopped at a bus stop. If you are looking for statistics try the insurance companies, as I have heard them make numerous sound bites on the subject on local newscasts.

This doesn't mean I support the law, I don't. I just believe many people can't walk and chew gum at the same time.

3820. Re: Relm out of the Scanner Business?

Newsgroup: rec.radio.scanner
Date: 1999-09-09 00:00:00 UTC
From: Zombie Wolf <zmbwf@somtel.com>
Message-ID: <7r8fn4$r2q$1@ruby.mint.net>
Source record: 107589

Whether you would make a lot of bucks would be questionable. Each and every feature added to the scanner`s design adds to the cost of manufacturing the scanner, since it adds to the complexity of the scanner. This cost is passed on to the consumer in the form of higher prices for the scanner, thus making it less competitive overall with other scanner, some of which may have a few of the features.
You also have to deal with what the scanner user really wants / needs out of his particular scanner. Users would be prone to buy the other scanner, because it is cheaper and contains some (or all) of the features that particular user is looking for. Why pay for features you are never gonna use ?
The features you describe are more attainable by computer - controlling the scanner, for intance, individual channel delays can be done on-the-fly in a computer controlled scanner. Banks and number of channels are no problem in the computer controlled environment. The computer memory is used as the channels/banks, so we have ultimate control over the programmability of those factors.
One of the other things that the scanner manufacturers "don`t get" (or don`t want to) is that the parallel port is the only way to fly with a scanner. You can hard - wire the staus information, squelch information, etc, so that a program doesn`t have to "retrieve" the info thru the damned serial port every time the scanner locks onto a channel. This slows down scanning speeds. I have no doubt that sooner or later (sigh) they WILL "get it", but is one hell of an aggravating wait.....

.hmmmmm...then I guess all those KY-28's connected to those UHF "AM"
aircraft radios I maintained in those aircraft in SE ASIA were only used for
ballist...and that was in '66 and it's still done today.....as for using AM in
aircraft radios it is and still is only because it does not suffer from the
"capture effect" like FM does. Once you tune an AM freq up it's damn hard to
cause it to lock onto an adjacent frequency that's stronger like an FM
receiver will.....that's why they use AM!......

been there, done that....

Len,

During the past 24 hours I've monitored F-16s working the Avon Park (FL) Range, F-16s and F-15s doing Air Combat Maneuvering practice over the Gulf of Mexico, F/A-18s just passing through and KC-135s refueling them all. All of this was in the clear and easily heard on a Uniden 9000XLT.
Be careful, though. Make sure the scanner you buy allows you to select AM mode in the 138-144MHz range. Not all radios do, and the F-16s in particular like to use those frequencies for air-to-air tactical comms, and these can be some of the most exciting. The Uniden 895XLT and new RadioShack Pro-2052 are examples of radios that include the 225-400MHz range, but won't allow you to select AM mode in the 138-144MHz range. Do not buy one of these if you're serious about military monitoring.

>they are risking lives by being their own self appointed expert.

Mike, I totally agree with you on this. The pilot should KNOW if the device is in use, so that he can be aware of any changes in his instrumentation. That is why I always ASK the flight crew and request they check with the pilot to make sure my scanner isn't messing with the plane.

Please, everyone, do not assume that my comments regarding in-flight scanner use are open license to sneak a scanner on board and listen secretly. ALWAYS ask first. And if they say no, then stow the radio. Period. No exceptions, no argument. That's not just my opinion, that is the law.

Thanks Mike for helping me clarify my stance on this.

The worst interference I've found is some monitors. At home,
I have two computer systems. One with an NEC monitor, the
other with an Optiquest. Both of these models are excellent
for RF emissions (got lucky). At work, I have a monitor that
came with a Gateway computer system (company property)
which is absolute garbage. It is about 3 yrs old and does have
a ferrite installed on the video cord. This isn't to improve
emissions, only to decrease noise going into the video circuitry.
At my office, I have a PRO-90 sitting on a window
approx. 8 ft from the monitor. It has a very difficult time scanning
with all the RF emissions from this monitor. I have to crank
the squelch up almost all the way up before it will continue scanning.
If I turn the monitor off, the background noise is completely
eliminated. On the other hand, with my home setup, I have
a PRO-2042 with an OS535 interface installed and a
BC245XLT sitting within inches of the two monitors.
Absolutely no interference. Try turning the monitor off to verify
that it isn't the source of the emissions. It is much more likely
that it would be the monitor than the computer itself.

Dan,

Neat idea. I have some similar systems at my house. Since I live
in FL, we experience power outages rather frequently from lightning
storms and for longer periods if a hurricane thumps us. I use a
deep cycle battery in the garage with a 12 VDC fluorescent lighting
system that automatically comes on when the power goes out (relay
drops out when 110 VAC goes off). I have a 4.2 KW generator
stored in the garage for long power outages and have found it
very difficult to roll it out and set it up with only a flashlight. I would

be worried about bringing an unsealed lead acid battery inside
the house, especially if it is charging (potential explosive gas hazard).
Inside, I used multiple 7 amp 12 VDC gell cells. These will run my
scanners for very long periods. These batteries are very safe and
are non directional (nothing to spill).

My conversion van has a dual battery system with a 1500 Watt
inverter. During the recent power outages, I run an extension cord
from the van's inverter inside the house. I use it to power lights
and a fan (still in the 80s at night here). I have also found that the
chemical lights (cyalume) work great. They provide plenty of light
during an emergency and last all night.

I've found a great website that covers emergency preparedness:

http://TheEpicenter.com/

Some of their stuff goes a little off the deep end, even for me! Be
sure to check out their "tip of the week" section. Great info on
generators.

I think Mir was pretty much the Main event in here. I'm disapointed that she's pretty much a goner now. I have enjoyed Listening and contacting the station many times.

I think a lot of people in here share the same thoughts. But Mir is old, and outdated, and costing our Russian friends a whole whack of cash to keep a crippled station alive.

Guess we will all have to wait a few years until the HAM Station on board the ISS goes online.

Mir was a perfect ham station, you didn't need expensive hardware or skill to contact it, Just a license and the right gear, and you could hear it with a simple handheld or scanner. The two others that come to mind like Mir were DOVE (DO-17, which I understand now is still silent) and that russian bird, that came up earlier on in the year, I can't remember the exact name, but it WAS a Sputnik.

Most people don't have to resources and cash to build a fully operational Sat station, I know I don't. Not to mention that I live in an apartment, and how would I explain an AZ/EL Rotor on the balcony. That is why Mir had so much appeal. And probably why the conversation has dropped since her Death.

Paul.

Hello,
Has anyone heard of a Cobra Curve Tracer ? Model CT-751
It is a small box with 3 switches- on/off, gain-junction-leakage,
calibrate,b-e, b-c
a socket for a transister under test, and 3 leads red , black, yellow.
and a place to hook it to the vert & horz. on a scope.
It says it was made in Polaris ,NY which I can't find on any map.
Does anyone know of this device . I have hooked it up and it sames to
work fine but I would like more info on it.
Also as if you couldn't tell it is rather old.
I would be greatful for any help.
Thank you.
Jeff

Believe me, if they wanted to undertake making such a non-PC controlled scanner at a reasonable cost and make a good profit off it, they could. However, by slowly adding features with every new model/line they keep the profits coming in.

>a program doesn`t have to "retrieve" the info thru the damned serial port

Well yes, I guess I haven't. I'll believe it when I see it on their shelves, or know someone who can show it to me. Of course, by then we'll have upped the ante with digital Tx and the desire\need to receive APCO-25 transmissions. Calculated profit longevity.

It's not, it's just been covered recently. There's probably a faq on
the subject.

For the record, I believe the gist of it was that Canada's laws are far
more lax. You are merely required to keep what you hear to yourself.

http://www.antennasmore.com (local business here in Utah) sells more durable, higher power solar cells. They also sell a simple, fully sealed charging circuit. Their solar+battery setup is geared towards gell cells, not sure if it will work with a lead acid battery like that one.

The solar cells they sell are laminated onto aluminum, framed, and the electronics sealed. they have diodes between the cells so that if one cell stops working the rest of the panel is still useful.

They have been known to withstand things like being shot several times with a deer rifle. Certianly they withstand simple things like being dropped, stepped on, whacked around.

I don't work for Antennas & More, but I know of the owner by reputation, and many of my friends worked for him back in the Antennas West days.

From: bigmoron <bigmoron@hotmail.com>
Message-ID: <37D9E686.1D414DAF@hotmail.com>
Source record: 107367

Can anyone advise me if a 900 Mhz "spread spectrum" cordless phone is monitorable by common scanners? Specifically, the brand is a Toshiba, and the manual shows the frequency range as 904.2 to 925.8 Mhz. I've tried using a Scout 40 set to reaction tune an AR8000 and found that it doesn't register a frequency but does show activity on the bar, and I also tried searching that specified range on a scanner and didn't hear anything while using the phone. I've heard that they cannot be monitored but I would like to get some confirmation from someone who is knowledgeable on the subject.

You will find "they" will jump 21 channels if they stay on the same cell site. So figure out the freq's in use @ that cell site out back & set up the channels in your accordingly.

3853. FS Alinco DJX10 Outfit 3 mos old REDUCED!

Newsgroup: rec.radio.scanner
Date: 1999-09-10 00:00:00 UTC
From: llklodt@aol.com
Message-ID: <19990909231608.01524.00000282@ng-cd1.aol.com>
Source record: 107397

Hi all....I am REDUCING the price on my Alinco outfit to $350.00. Below is a copy of my original ad. Wife says the radio or me has to go! HELP! THanks!
Hi! I have for sale a Alinco DJX10 outfit. I purchased this new from grove at the end of May, and have found that it is just too much radio for me. It is a great outfit! Everything is in BRAND NEW CONDITION, with ALL manuals and boxes. Here is what I have:
Alinco DJX10 1200 channel scanning handheld, which covers from longwave up to 2GHZ! All modes, AM, FM, NFM, WFM, CW, USB, LSB, channel scope, computer programming, Alpha Tagging and much much more! Very rugged built and a great preformer! Include in this outfit is alos 2 Ni-Cad battery packs, a AA battery case, a drop in desk charger, protective case for the radio, rubber duck antenna, telescopic deluxe antenna, Icom Programming cable ($45 new), REGISTERED software, NEW UNOPENED Alinco filtered cigarette plug, and wall wart.

This outfit was purchased in late May from Grove, and is in BRAND NEW CONDITION. I have well over $550 in this outfit, but have decieded to sell it due to the fact that I have too many radios and not enough time to use them all. I am asking $400 (REDUCED TO $350!) shipped via UPS or USPO Priority included. If any queston please email me. THanks all!

LARRY :-)

You might also try a better case. Some cases are much better at
keeping the RFI from leaking out than others. For example, there is
noticeably less interference from my HP Pavilion than there is from my
other computer with a cheap clone case.

>those lines.....

Yes, I know about those, but they're not quite what I was talking
about. Of the two programs on eavsdropper's site, one only works with
ETACS and requires you to solder a bunch of wires to the circuit board
of a particular model of cellular phone which isn't being manufactured
anymore, and the other seems to want you to connect the audio output
from your scanner to a COM port on your PC (no mention is made
regarding what, if anything, is supposed to go in between, much less
how to build or obtain one). In other words, these things are pretty
much useless to the vast majority of people. As for these being
"current" developments, these programs appear to date from around
1992.

I'm surprised there in't something a little more modern, along the
lines of POC32 or MDT Monitor - something Win32-based which uses
either a soundcard or a hamcomm data slicer interface.

>and is there a scanner capable of intercepting those comms?

Yes, the frequencies are still in use, and there are plenty of scanners that
will tune the range (almost all scanners, actually) but many of the new
military radios use frequency hopping and encryption, which makes it impossible
to understand what is being said, even if you do find the right frequency.

Over in sci.geo.satellite-nav, there are regular reports of both
pilots who permit the use of GPS receivers during cruise and those who
disallow their use. I'm sure there will be a similar distribution of
opinions among pilots regarding scanning receivers.

>The military has switched over to a trunked like system for
>communications and all US Army communications are encrypted as
>of the early 1980's.

Sorry, this is disinformation and absolute bullshit. Army comms are frequently heard in the 30-50MHz range. Earlier this summer war games at Camp Blanding in North Florida produced a lot of good listening. Yes, encryption is used sometimes, but a lot is in the clear, too.
If you're interested, join Commo@onelist.com as the folks there post a lot of these low band loggings with frequencies and callsigns.
As for a "trunked like" system, I can only guess you're talking about SINCGARS which uses frequency hopping. It doesn't work anything like a trunked system, but I guess that's close enough for some people.

>Some Military air communication >channels are still unencrypted though.

Probably 99 percent of military air comms are in the clear, although datalinks are becoming more common. The frequency ranges are generally 138-144MHz (AM mode) and 225-400MHz (AM mode). Of course, military aircraft can and do use the 118-137MHz civilian airband as well. Army choppers and USAF A-10s like to use VHF Low, btw, usually in NFM mode.

>Some Bases have created trunked systems in the 406-420 MHz

Hello to all. I would like to invite you to "Scanning a Mile High" the up-and-coming scanning site for Colorado. Stop by and check it often as it is still in the building stages. New information is put on every few days as I have the time to add information or as some one informs me of new information.

http://home.mho.net/n6rhl

Stop by and check it out.

Thanks, Dave

Since FO-29 is now in digitalker mode, I am distributing this FAQ to the space groups.

Since the previous posts on working the FO29 digitalker, I have been asked several questions on how to hear the FO-29 digitalker. What follows is sort of an evolving FAQ. Feel free to distribute this document. KF4FDJ - September 10, 1999

The Japanese satellite, Fuji Oscar 29 (JAS-2), was launched on August 17, 1996, by H-II rocket No.4, along with the earth observation platform satellite ADEOS, from Tanegashima Space Center of NASDA (National Space Development Agency of Japan).

FO-29 is a small LEO (Low Earth Orbit), Japanese owned satellite containing a digitalker, mode JA transponder, and 1200/9600 baud packet capabilities. The mode JA transponder requires a SSB, or CW uplink signal on 2 meters, and transmits a downlink SSB/CW signal on 70 centimeters. Mode JA is a full duplex mode. You WILL hear your own downlink, which is crucial, in order to compensate for doppler. The satellite is also capable of mode JD, (digital) at 1200/9600 baud.

Q Is Fuji Oscar 29 always in digitalker mode, and what is it?
A The digitalker on FO-29 is a digital loop announcement, which makes the same announcement over and over. You will hear, "Ho- ho'kke'kyo, this is JAS two." The first part is the song of a bush warbler. JARL (Japanese Amateur Radio League), plans to cycle digitalker, mode JA, and mode JD. The digitalker message is subject to change. Check announcements on the BB for a mode schedule and other details.

Q Do I need a multimode rig to hear the digitalker?
A Since FO-29 transmits in FM mode while in digitalker, any FM or multimode receiver capable of tuning the 70 cm ham band should be able to detect the signal.

Q Do I have to use a high gain antenna to hear the signal?
A Digitalker operation dedicates most of the power budget of the satellite to the FM transmitter, instead of spreading it across a mode JA transponder. It is a very strong signal! It is possible to hear the satellite with a handheld scanner or transceiver, and a stock "rubber ducky" antenna. Most 70 cm base stations, or scanner listening posts, with fixed antennas, should also be able to tune the signal.

Q I've heard that a circularly polarized antenna is necessary to hear FO-29. Is this true?
A While a circularly polarized antenna will help on mode JA, it is

not necessary with the digitalker. It REALLY is possible to copy the signal with a handheld device and a "rubber duck" antenna. We have been successful with a Yaesu FT-50R and a stock antenna. You will need to rotate the rig (and antenna) for the best orientation. Experience shows that horizontal polarization, with the axis of the antenna perpendicular to the satellite gives the best reception. Experiment!

Q Where do I tune to hear the signal?
A The transmit frequency is 435.910. Of course, you will have to compensate for doppler shift. Just remember you will tune a little higher in frequency as the satellite approaches your position, and a little lower in frequency as it recedes. You will always be tuning higher in frequency when the satellite comes over the horizon. Make sure you have your radio set to tune small increments, as increases and decreases in doppler are gradual, and linear.

Q How long will I be able to hear the satellite during each pass?
A Since FO-29 is a low earth orbit satellite, most passes will be between 6 and 18 minutes in duration. Timing is critical in working any amateur satellite.

Q What is the purpose of the digitalker?
A The digitalker presents an easy opportunity for hams and non hams to have their first taste of real time reception of signals from space. Use this opportunity to show a kid, or a terrestrial ham how easy it can be to tune a satellite. This opportunity is excellent for scout meetings, monthly ham meetings, schools, or any place where nquisitive persons congregate.

Q How will I know when the satellite is over my location?
A You will need a program to generate predictions of when the satellite is "visible" to you. An excellent place to find downloadable software for real time tracking of satellites, and other information on the amateur satellite program in general, is:

http://www.amsat.org

Be sure to download the latest keplerian coordinates if you download a tracking program. Each prediction program needs these coordinates to determine where the satellites are, and to help you determine when FO-29 will be over your horizon. Another casual approach, is to use an online prediction site, such as:

http://acsprod1.acs.ncsu.edu/scripts/HamRadio/sattrack

This site will generate pass predictions for a selected satellite.

If you have any comments, additions, or modifications to this document, please contact me directly. We will attempt to post the latest version whenever the satellite is toggled to digitalker mode.

73, Mike KF4FDJ

It is a rare event, to be sure, and it certainly will not happen with
most scanners. HOWEVER, similar things have happened. See
http://olias.arc.nasa.gov/ASRS/cb_201.html

>I have yet to hear one pilot agree that a scanner on a plane is dangerous.
>I'm no expert, but these people are - at least the FAA thinks so....

I'm an instrument rated private pilot and an electrical engineer who
works on communications systems. While I am not a final authority on
this subject, I probably have a better perspective than most pilots.

I would use a scanner while cruising. However, if I were a passenger,
I would make sure the pilot knows what I'm doing. During takeoff and
landing, I would turn off the unit.

>How about it? Is there any REAL pilots out there who disagree with the dozen
>or so that I have personally spoken to? I sit next to one here at work
>(private pilot), I'm sure he'd be happy to share his opinion on this. He's
>one of the ones who said scanners in flight are harmless.

The bottom line is this: Regardless of whether your radio meets FCC
part 15 or not, it can still affect the navigation equipment in an
airplane. Why? Because the navigation systems commonly in use today
were all created in the early 1950s. The only really new thing in
aircraft navigation today is GPS.

Let me introduce something about the history of the world and the
technology at the time. World War II has ended. There have been some
truly amazing aviation advances. The world needed a short haul
aviation communications systems and they needed them world wide,
immediately.

So they created the VHF AM communications plan which is still in use
today. Unlike most communications standards today, this quickly took
hold world wide. Shortly thereafter, we created the VOR and localizer
receivers for navigation. These were also based on AM. Why? Because
back then, FM was very new and few technicians understood it.

Go fast forward to the end of the century. The navigation system they created nearly 50 years ago is starting to show its age. Back then, there were few gadgets a passenger could bring on the airplane which could mess with the navigation. Today, they're commonplace. Back then, VHF was mostly a waste-land. Today, it's some of the most crowded spectrum around.

The problem is that the navigation systems are based on subcarriers riding on an AM signal. These can be interfered with very easily. An LO, a microprocessor clock, or even rhythmic static generated by a dirty cassette tape transport motor can screw things up. Unlike an FM based system, the readings of the instruments are affected by the strength of these subcarriers. There is no capture effect at work to save you from the low level noises made by so many electronic do-dads.

It is amazing to me that the system works as well as it does. It can guide a jet flying at 160 knots to a window of airspace only a few feet thick by twenty feet wide at two hundred feet off the ground. Doing this with GPS --even without selective availability-- is a struggle (you need local correction data to clean up the geometry).

The problem is this: Too many countries and too many aircraft have already sunk unholy sums of money in to these old systems. They're not going to change until something cheaper, more reliable, and more universal comes along. GPS still scares a lot of countries because it is managed by the US military. But even if it didn't, coordinating over 100 countries toward a new navigation standard while the old one still works, is like herding cats.

So we're stuck with what we've got. Yes, it can be sensitive to interference. No, there is no practical way to determine in advance what will cause interference and what won't. And truthfully, 99.999% of most consumer items, including scanners, won't cause any problems. It's that last 0.001% which frightens the FAA. Would you take the chance of a 50 foot error while you're screaming at 170 MPH to a window of sky only 200 feet off the ground?

Even I have limits...

Regardless of people saying "I know someone", which should actually start out "Once upon a time" (or if it's a sea story, "No S___!") the bottom line is scanners do radiate. Some more than others.

That's not open for discussion, and any pilot that says that they don't is full of it.

Now the question is will it interfeer with the safe operation of an aircraft.

It MIGHT!

I don't want these know nothings saying "My pilot friend says...." That's BS. Until it's actually tested and CERTIFIED as not interfeering with the anitiquated and marginally sufficient system we now have on aircraft, the answer is "IT MIGHT!" Just because it doesn't for a pilot that is stupid enough to turn on a scanner and think it doesn't seem to is NOT proving that it doesn't.

It MIGHT!

That does NOT mean it will. That does not mean it won't. It's means it MIGHT!

With that in mind, any competant pilot should KNOW if these devices are operating, and if the safe operation of his aircraft depends on anything that MIGHT be affected by them, he should have them turned off. Anyone who hides the operation of a device that might interfeer with the safe operation of the aircraft should be thrown in jail for being more reckless than any speeding teenage driver or drunk who brandishes a firearm in a bar. The point is they don't KNOW, and they are risking lives by being their own self appointed expert.

Over here in L.A. they're pretty active, doing work for small cities that don't have huge fire depts, and get strected thin from time to time. If you go to the Percon database, do a search under "Laidlaw". It seems that Laidlaw merged with AMR a few years ago, so they inherited some of their frequencies. Just for reference, the AMR freq that I've gotten hits on is 45.88.

Yes. Its not an issue of "whether its logical or not for
scanners to cause interference," its up to the pilot,
regardless. Where the company itself may not prohibit the use
of this or that, the pilots can have the final word, themselves.

Anyone have a good source of headphones for scanners? I am going to take my radio to a NASCAR race soon. I need headphones that will block the noise. This will be the first time I have used a scanner at a race, any tips? The race will be in Atlanta. Anything else good to listen to while I'm there for the weekend?

Thanks. sstivers@lexmark.com

I'm modifying a BC760XLT and I'm figuring out the keyboard
matrix. I thought it would be very similar to a PRO-2026,
as they are close cousins. Unfortunately, this isn't the case.
If anyone has the schematic for a 760 and are willing to
scan (just the keyboard matrix portion) and e-mail me, I'd really
appreciate it.

Thanks,

Robert

What point is there to annoying scanner users in the uk and australia
with a non-scanner-related argument that is meaningless in their
country?

For that matter, why the cross post to soc.penpals?

You don't say what kind of mod you are looking for. I tapped the discriminator audio on my BC895XLT so that I could use it with the ETrunker program. The instructions for tapping the discriminator can be found at http://www.lcblanton.com/dfw/interface.htm
If this isn't the kind of mod you are looking for, then perhaps you could be more specific.

>Death.

Eventually I'll get together a better sat station. I can do it now
but logically I can't spend the money on it at present. I will be
buying an all mode 2m/70cm rig, probably the IC-821H in the next 6
months or so.

Mir's appeal (one of them) was it was very easy to work by any ham and
easy to listen to for the non-hams. I'll miss Mir a lot. But won't
forget her.

>Paul.

George has some good info. I use them at airshows. Only thing is, DC
headsets are very expensive.

Many headsets used in aviation or elsewhere, will serve you as well at half
the price.

I have a program and some files, I pulled from a scanner BBS a while bck
that lists all the cellular channel numbers and frequencies. I also have a
few ASCII files that explain the theory behind cellular telephones..etc.

Now, it seems the WWW is more popular then a BBS.... I used to have fun
dialing up BBS systems around the country and searching for scanner
related files

Semi off-topic post.... but it was asked on this newsgroup so......

Someone a while back asked "Who is the moderator for this newsgroup (usenet)?"

Below I am providing the URL which details a list of moderators for many of the usenets....

http://www.landfield.com/faqs/moderator-list/part1/

Hope this helps answer your question.
And as always.... thanks for your support of the hobby of radio scanning !
There.... that brings it back on-topic.
Have a GREAT one !

Source record: 107300

>From: Wynand Groen wynand@home.com

>Hi,
>I bought an IC-R10 but do not know how to operate it. I also would like
>to know the cell phone range
>Can you help me? >>>>

As the R10 is a bit more complicated to operate than your older Unidens and Radio Shacks I would suggest you read the manual and try each function while reading... When I bought my R10 I attempted to operate it without reading first.... what a mistake. Just to enter one frequency into memory demanded many pushes of the keypad. It's a GREAT little radio... when you master the operation. Being it has so many features it uses each button for multiple functions. If you have the computer cable and software programming will be much easier. Because of its complexity it would be very hard for someone on this newsgroup to answer your reply differently than I have just done.... unless they want to re-enter the text from the manual here.
As for the cellular range.... go to this URL:

http://members.aol.com/noobody/r10mod.htm

The operation of this radio appears to be a bit scarey at first but once you do it a few times it becomes second nature.
Hope I've helped a bit.

No they are NOT the same!!! A tower can be a radio tower, a TV tower, a Microwave tower etc.... A cell site has a tower but is a cell site because of the equipment located in the building at the base of the tower and the antennas connected to that equipment!

>anything while using the phone. I've heard that they cannot be
>monitored but I would like to get some confirmation from someone who is
>knowledgeable on the subject.

Why not search the net....you'll find some sites that are devoted to Spread Spectum....and they in turn will give you links to other sites where you will find the following examples of how spread spectrum operates:

Spread Spectrum Radio Signal
In performing Spread Spectrum, the transmitter takes the input data and spreads it in a predefined method. Each receiver must understand this predefined method and despread the signal before the data can be interpreted. There are two basic methods to performing the spreading: (1) Frequency Hopping, and (2) Direct Sequencing. Frequency hopping spreads its signals by "hopping" the narrow band signal as a function of time. Direct sequencing spreads its signal by expanding the signal over a broad portion of the radio band.

The FCC allows the use of Spread Spectrum technology in three radio bands, 902-928 MHz, 2400-2483.5 MHz and 5752.5-5850 MHz for transmission under 1 Watt of power. This power limit prevents interference within the band over long distances.

So check out the following site for more info on the subject...
http://sss-mag.com/sstech.html

enjoy.....

Depends on how you mean "Off" - since that varies with computers.

Most new ATX type PCs shipped in the last 3 or 4 years aren't really
"off" unless you reach back and flip the switch on the back of the power
supply, or unplug them, or otherwise cut their power supply. On several
of them, after turning them off, you can even observe a lighted LED on
the motherboard.

Most macs are the same way. Turning them "Off" merely shuts down most
of the major components of the system - the motherboard logic is still
somewhat alive.

3928. Re: cellular towers a health hazard

Newsgroup: rec.radio.scanner
Date: 1999-09-11 00:00:00 UTC
From: Eric Jorgensen <alhaz@xmission.com>
Message-ID: <37DA6FAA.8B000ADC@xmission.com>
Source record: 107310

After various european governments made condemning statements about the health effects of high power lines - I believe specificly the allegations that they can cause or advance leukemia, the department of energy decided to see if they could duplicate those findings in a clean laboratory environment.

So they went out in the desert somewhere and they built several blocks of city power grid, with high-tension lines running through the middle, simulated household power loads at most of the points where a house would be, and a fully modular "lab house" right undernieth the high tension lines.

What they found only confused the issue more. They said the EM levels at the house were not particularly high - not significantly higher than test points a few blocks away from the high tension lines. And that depending on how they varied the test loads around their grid, the EM levels inside the house directly undernieth the high tension lines could actually be much lower.

They further experimented with appliances in the lab house, to see if varying loads on the power circuits inside the house could make a big difference.

What they found when they did that was even more confusing. They found that it actually made a *huge* difference whether the microwave or the toaster was plugged into the top outlet on the counter, unless the microwave was on the left instead of the right. They made several other seemingly random but 100% reproducable observations.

In short, they found that they could not make any definate, scientific recommendations about avoiding hazardous electromagnetic fields, since something as simple as plugging in a clock radio on one end of the house made a larger than expected difference in the EM fields in the kitchen on the other end of the house.

Do electromagnetic fields make a difference in biological processes? Sure they do. Do we know for sure if the levels experienced by urban humans are harmful? The DOE says we don't. Yes, if you place a big coil around the incubator and gauss out the eggs, the chickens sometimes hatch weird. But you're not wearing a coil on your head 24/7.

Personally, I believe that humans put their physical well being at far more risk by subjecting themselves to urban stresses than by subjecting themselves to 60hz em waves. In the wild, stress is the leading cause of death among many of the species that have herding instincts. At least, after you subtract predators.

And then there's the oddballs. The leading cause of death among bald
eagles is smacking into the ground during the mating ritual. The leading
cause of death among cheetahs is getting kicked in the nose by a zebra.

but I've gone way off on this tangent, sorry about that.

I once saw a kit advertised in the back of an electronics catalog that supposedly helped consolodate the spread signals somewhat - I don't know if it actually worked, or if it worked well enough that you could actually understand what was being said.

That's interesting. I thought for Edacs systems the position of the channels was critical, not just the order. Of course doing it all in one bank means you can't take advantage of multitracking to scan or search both systems.

Source record: 107318

Keep looking Larry. You can't just "unblock" a 2045. The processor was never set up to send the correct data to the PLL to tune those frequencies. I have no doubt that the circuitry is all there to recieve cell freqs, but you're going to have to do some heavy duty digital work to make it happen. Sorry, You can't just clip a diode anymore.

Hi, again. If it is an ATX it can still interfere even when the PC is off. This is why I started down the road of solving the problems I had as it jammed up all MF radio's in the house.

The reason is that even when the PC is off the PSU still has a residual output (and hence the inverter is still running) in order for the ATX soft power up/down function.

So if you are having problems the only way to completely eradicate them is to unplug the PC. Though in my case the IEC filtered socket solved the problem.

BS

HELP HELP- ANY INFORMATION APPRECIATED

I'm having NO luck finding any information on:

1. Locating a schematic for Uniden BC 2500XLT

2. Locating a schematic for Uniden BC-200XLT

3. In addition to obtaining these schematics, I really want to know how and where to install an analog S-METER on both of the above scanners(the specfic place on the circuit board to tap into, so an external s-meter can be installed}. THANKS FOR YOUR HELP.

> want to listen to, the scanner will take care of the rest.

I tried the procedure you suggested and could not get the second system to track. After 30 seconds or so it would lock up on the data channel and stop searching. I was able to enter a Motorola system after an edacs system in the same bank and track either one. To do that it is necessary to change the system type to match the one being tracked. If you have gotten two Edacs systems to track in one bank, I missed something. Please let me know how you made it work. Thanks.

According to info on the Strongsignals site, the BC200XLT is the same as the Radio Shack PRO-46. You can probably get a service manual for the PRO-46 from Radio Shack http://support.tandy.com/support_electronics/doc30/30406.htm. Didn't see an equivalent for the BC2500XLT listed.

ABLE is a phonetic for the letter A, BAKER is for letter B, CHARLES or CHARLIE is for letter C, DAVID or DELTA is for letter D, and so on. The lettters could be used to identify a certain part of town, a specific work shift, a certain helicopter, a different video feed, etc.

I can't find an acars group but I know some of you scanner types like me may be able to help.

Does anyone know of a program I can use to take the SERIAL output from a Universal M450 acars decoder and use it with the Airnav program?

The M450 does a much better job of decoding than wacars or kracars.

Hey gang! We have been flooded with e-mail regarding the up and coming release of the Police Call CD-ROM. I am going to take this opportunity to answer a few of the most frequently asked questions here.
* When is the program going to be availble?

We are scheduled to go "gold" in the next week or so, and should start shipping CD's to vendors by mid to late October.

* What is the CD going to cost?

The suggested MSRP of the CD is $ 34.99. This price may vary from vendor to vendor.

* Do you have the permission of the Police Call people to do this?

Of course we do. We have worked very closely with Gene Hughes' and his people on this program. The program has had to meet Mr. Hughes' strict standards in every last detail. This is part of the reason that the program has taken so long to develop.

* I have a submission for the books and/or CD. Who do I send it to?

Please goto http://www.policecall.com for information on frequency submissions.

I want to take this opportunity to thank everyone who has sent us e-mail on the CD-ROM. As more information becomes available, we will post it on our web site as well as a message on Usenet.

If anyone has any questions regarding the CD, please do not hesitate to send us e-mail. We welcome the input from everyone.

Warmest Regards,

Adam Goldman
Chief Operations Officer
Pozilla Software

According to the information at
http://ourworld.compuserve.com/homepages/brennan/guide.htm
Hickory has two systems. If you are trying to program them both into one bank, you will go crazy trying to make it work. Use two banks and program the frequencies in the exact order they are listed on Terry Brennan's website. Remember to put the radio into trunk programming mode and select an Edacs type system.

I just got a BC245XLT trunk tracker, the only 2 problems i found was
that the US cellular frequency's are locked out but these overlap with
the motorola trunking system, only by 1Mhz but if i was interested in
listening to it it could be a problem. the other is different frequency
stepping, i have only noticed this in the 2M band when listening to
pagers and decoding them with poc32, the scanner wont let me sit right
on the frequency (only 2.5Khz off) and poc32 will not sucessfully decode
them, apart from this, the police,fire,ambo ect are beaut.

Better yet, since this is Australia, you should drive left unless you
are speeding. We have an unwritten law that law abiding drivers stick
to the left lane leaving the right lane clear for people who want to
speed. The absence of police encourages that sort of behaviour.

I am about to purchase a scanner and am very interested in the computer models. Could someone please give me their opinion on what is the best one as far as quality. I am planning on mounting the unit in my vehicle, which brings me to my next quest. What would be the most practical antenna for mobile operation. I know that it depends mostly on what freq.. I am wanting to receive, but I am not quite sure of that either. Like I said, I am just looking for some "friendly/constructive" advice.

Thanks

Robert Green

This is the kind of thinking that kills Constitutional Rights!
Allowing government controls on what people are able to talk about! How amazing that any American would allow himself to be restricted in this fashion when many men have died to set him free from limitations on speech, and to make sure he has all of his other rights secured.

We are now moving into a new age! Americans are becoming much more willing to walk lock step according to government rules even when those rules deny them their just rights and liberties!

"Government is great! Government is Good! Let us thank Government for our food! Amen."

The next thing on the horizon: "You thought an unapproved thought! You will be reported to your block captain!"

Question:

Do you sleep near 110 volt lines in your walls? Does your home or apt sit near
power lines? If so, the magnetic fields around those wires may affect the health
of everyone in your home. Nothing has been proven except that such fields do
alter cellular operations, and Im not talking about cell phones here.
Think about it.

You will not hear active duty tactical ops in the clear... I spent time in a FA unit and the only clear traffic we had that was not secure was range control for safety reasons.

You never...ever.. transmit in the clear except for range control purposes or extreme emergency.

The "old" style military radios use the below mentioned freqs... with an added security module for voice or digital. The "new" radios do things different and have security features built in. I'm not going to spell out what they do...but you can look around on the net and see them.

It's a simple ENG(type) Microwave system. The type used in news helos and live trucks. We use 2ghz transmitters and receivers made by California Microwave in our trucks and helo. The TX/RX can be in the omni or directional mode. Chances are that ABLE uses an omni system to transmit to the command post or dispatch center. NTSC/FM...off the shelf is 5 to 10 thousand dollars(new). No restrictions about watching the feed. No special permit required to buy a receiver. But you will need to know the sub carrier for the audio. The antenna is probably the rod type mounted to the skids and deployed by servo motor after liftoff.
Or it is very directional and fed to a receiver on one of the many suitable mountain tops (i.e.) Mt. Miguel, Mt. Soledad, Woodson peak, Palomar etc.
If the system *is* in use and the directional type...your chances of intercepting the signal are pretty slim.
But if it is an omni your chances are much better.
BTW the FCC has been in the process of refarming the 2ghz band to make room for PCS. So the frequency could change at anytime. Most TV stations have to respace their TX/RX systems very soon.
The London Metropolitan police have been using these systems for many years now.

I quite agree with what you said , Mir gave me my first experience of "space comms" and has provided me with some great
opportunities to show others the hobby (albeit with a few errors from time to time).

Can't wait until the ISS is up and running for a new era in this hobby, it would be nice to think that one day we could
have things like a permanent sstv station etc, but all in good time i guess !

well...here's to waiting :-)

If you don't think so then you need to spend a bit more time monitoring
the frequencies, particularly if you live near a base.
True, you're not going to hear SEAL Team One chatting it up the next time
they do a HALO drop into Baghdad on a recon mission but you can hear a lot of
interesting training comms. Frankly, I hope I never hear REAL combat
communications on my scanner, 'cause if I do that means the shooting is TOO
DAMNED CLOSE!

From: Jonathan Clough <Clough@Javiation.co.uk>
Message-ID: <3jMsFHAK5i23EwQv@Javiation.co.uk>
Source record: 107391

In article <#r2Dga7##GA.270@cpmsnbbsa03>, Jorge Morales
<Sycho_Graphics@msn.com> writes

Hi,

>I need a PC interface for my AOR 8000 anyone have one they are not using.
>Also, I have been looking at the Optolinx is it any good? Suggestions?

There are a number of interfaces for the AR8000 that I am aware of
although I'm sure there maybe others produced by some...

* AOR "CU-8232"

* Javiation "RS-8000" or "JAV-232"

* Optoelectronics "Optolinx"

* Computer Aided Technologies "CAT-232"

* You could also build your own if you wish to go that way using a
MAX232/232/233 IC. There are several diagrams on the net.

If you go the latter route connecting your interface to the radio can be
the hardest part. The AR8000 uses a Flat Flexible Cable (FFC) which are
not readily available (FFC's and sockets are available from us though).
You will often see references to AR8000 modified with various "Sockets"
to the side for Computer control where users have made there own
interfaces.

Hope that helps.
Cheers,
JC

3992. Hurricane Watch Net active 14.325 Mhz

Newsgroup: rec.radio.scanner
Date: 1999-09-12 00:00:00 UTC
From: Radio 4 <Radio4@hotmail.com>
Message-ID: <7rhgvp$g96$1@ash.prod.itd.earthlink.net>
Source record: 107201
Cross-posted to: rec.radio.amateur.misc,rec.radio.scanner,rec.radio.shortwave

The Hurricane Watch Net has been activated on
14.325 Mhz USB. This is a very informative network
of volunteer Amateur Radio stations who provide
information within the affected area of a hurricane.

Shortwave listeners and other interested parties
should monitor this frequency for bulletins and
information.

The Hurricane Watch Network has a webpage. It is
located at www.hwn.org Bulletins and further info
is available at this page.

Licenced Radio Amateurs in the affected areas should
monitor this net and *do not transmit* on this frequency
unless directed to do so by the Network Control Operator.

I like to use walkman headphones, doesn't draw attention and has great audio.
You could actually split the wires and put mono plugs on each channel and
listen to two radios at once.

To increase the signal of your phone you will need to attach an external antenna with 3db gain, the patch style antennas are usually gimmick's and work in very few conditions.
Larsen at www.larsen.com sells some passive antennas
Passive antennas are like an antenna on top of your television if not connected, you may get some picture on rainy days, but you will usually get snow on the screen.

4003. Best Ways to Reduce RFI?

Newsgroup: rec.radio.scanner
Date: 1999-09-12 00:00:00 UTC
From: Douglas Schnell <dschnell@oxy.edu>
Message-ID: <7ri6je$3rr@sophri.cc.oxy.edu>
Source record: 107212

Folks--

Not sure if this is the correct place to post (if you have any suggestions as to more appropriate areas, feel free to pass them on), but I thought I'd try anyway:

I purchased a KVM (keyboard, video, mouse) switch from Apex for use on a home network. Unfortuantely, it is a Class A device and provides a rather serious level of RFI on the TV located in the same room. Unfornately, I don't have access to cable so I'm forced to use my existing antenna setup. Apex has no solutions (other than moving the TV and switch further apart). My feeling is there must be some sort of RFI "filter" or "deadener" on the market.

The switch and TV are isolated on different outlets, with the switch further removed from regular wall current by an APC SmartUPS 1400 power supply. There is no way to isolate the two on different circuits, however. Based on the isolation already in effect, though, I don't think this is a problem with feed through the electrical line. I am convinced it is from an RF field given off by the switch.

I could warp the switch in aluminum foil, but this is a less than attractive option. Does anyone know of anything that might help? Again, if you can refer me to a more focused newsgroup on this subject, I would be most appreciative.

Thanks.

On Wed, 8 Sep 1999 20:42:21 -0400, you wrote:

>Randy, would you mind giving any pointers on this? Kind(s) of LEDS,
>where'd you mount them, anything electrical within the circuit to
>worry about, etc.? I appreciate any and all help sir. I'm good
>with a soldering iron and know some things about
>electronics/electricity, but I'm no guru. Thanks.

Perform this procedure at your own risk!
It worked for me.

Remove the front of the scanner. Two screws on each side of the
housing. Pull out gently, there is a ribbon cable connected to the
back. Unplug the cable.
Remove the four small screws and the shaft nuts.
Remove PCB with the LCD display from the front housing.

On the small PCB containing the on/off and squelch pots, solder
one leg of a 47K resistor to the 12V solder pad.

If you look at the small PCB with the pots facing down, this will be
the second solder pad from the top right.

Hot glue three T1 3/4 green LED's to the Large PCB so that they will
shine into the plastic casing under the LCD. I put one in the middle
and the other two out towards the ends.

Trim the LED leads to enough to just solder to.

OBSERVING POLARITY, solder the LED's together in series with hookup
wire.
Negative leg of left LED goes to ground. I used the exposed solder
area around the screw hole.

Solder a hook up wire to the positive lead of the right LED.

Solder other end to the 47K resistor.

Reassemble. I left out the screw that goes through the hole where I
connected to ground.

Yes I agree with you Rick.Some of them are generally knowledgeable.There
was one Manager that worked at the store next to me that worked there over 7
years and SHE yes SHE knew allot about electronics,but unfortunately she got
tired of working 75 hours a week and lived 45 miles away so she quit.The
people that work there now have no general idea of anything unless it is
cellular or Direct TV.

Subject: FS: Motorola FRS #101 Pair $90
Date: Sunday, September 12, 1999 6:47 AM

I have a pair of Motorola FRS Talkabout Model 101 Radios that
I will sell and ship for $90. They are brand new (never out of Package)
Features:
1 to 2 mile range
14 UHF FRS Channesl
38 PL Codes
LCD readout
Voice for Channel and Code
Battery saver mode
Belt Clip
3 AA Bats
1 Year Warranty
Usueally sell for $90 each

Sell and Ship Pair for $90

If you have questions please call 701-282-6630 ......Ask for Tim.......

thanks

HELP HELP- ANY INFORMATION APPRECIATED

I'm having NO luck finding any information on:

1. Locating a schematic for Uniden BC 2500XLT

2. Locating a schematic for Uniden BC-200XLT

3. In addition to obtaining these schematics, I really want to
know how and where to install an analog S-METER on both of the
above scanners(the specfic place on the circuit board to tap into,
so an external s-meter can be installed}. THANKS FOR YOUR HELP.

4026. Earpiece

Newsgroup: rec.radio.scanner
Date: 1999-09-12 00:00:00 UTC
From: rhavedx@aol.com
Message-ID: <19990912135139.00611.00006734@ng-fn1.aol.com>
Source record: 107276

Does anyone know of a source for high quality earpiece's for scanners. What I'm looking for is an earbud type like you see the police or secret service using. I hope that somboby can give some suggestions. Most Radio Shack earpieces are not sturdy enough, and I'm out of ideas. Thanks in advance. Ron.

4027. Need help repairing Radio Shack PRO-2004 scanner

Newsgroup: rec.radio.scanner
Date: 1999-09-12 00:00:00 UTC
From: "Bryan V." <bryanval@erols.com>
Message-ID: <37DBECD1.AF28DCD0@erols.com>
Source record: 107277

When I enter certain frequencies on my PRO-2004 scanner and then press ENTER the frequency displayed is 8 MHZ less then the freq. entered. Only after the ENTER key is pressed does the freq. change.

Example:

Freq. Entered	Freq. Displayed
100 MHz	92 MHz
110	110
120	112
130	122
140	140
150	142
160	160
170	170
180	172
190	190
200	192
210	202
220	220
230	222
240	240
250	250
260	252
270	270
280	272
290	282
300	300

Otherwise the scanner works fine - the frequency displayed is the same as the audio frequency.

Has anyone else experienced this problem?

4036. [Fwd: Listen to the easiest amateur satellite! (FO29)]

Newsgroup: rec.radio.scanner
Date: 1999-09-12 00:00:00 UTC
From: "KF4FDJ (Mike in Ft. Myers, FL)" <seven77@gate.net>
Message-ID: <37DC1B6D.151063F@gate.net>
Source record: 107286
Cross-posted to: rec.radio.amateur.space,rec.radio.scanner

Since FO-29 is now in digitalker mode, I am distributing this FAQ to the space groups.

Since the previous posts on working the FO29 digitalker, I have been asked several questions on how to hear the FO-29 digitalker. What follows is sort of an evolving FAQ. Feel free to distribute this document. KF4FDJ - September 10, 1999

The Japanese satellite, Fuji Oscar 29 (JAS-2), was launched on August 17, 1996, by H-II rocket No.4, along with the earth observation platform satellite ADEOS, from Tanegashima Space Center of NASDA (National Space Development Agency of Japan).

FO-29 is a small LEO (Low Earth Orbit), Japanese owned satellite containing a digitalker, mode JA transponder, and 1200/9600 baud packet capabilities. The mode JA transponder requires a SSB, or CW uplink signal on 2 meters, and transmits a downlink SSB/CW signal on 70 centimeters. Mode JA is a full duplex mode. You WILL hear your own downlink, which is crucial, in order to compensate for doppler. The satellite is also capable of mode JD, (digital) at 1200/9600 baud.

Q Is Fuji Oscar 29 always in digitalker mode, and what is it?
A The digitalker on FO-29 is a digital loop announcement, which makes the same announcement over and over. You will hear, "Ho- ho'kke'kyo, this is JAS two." The first part is the song of a bush warbler. JARL (Japanese Amateur Radio League), plans to cycle digitalker, mode JA, and mode JD. The digitalker message is subject to change. Check announcements on the BB for a mode schedule and other details.

Q Do I need a multimode rig to hear the digitalker?
A Since FO-29 transmits in FM mode while in digitalker, any FM or multimode receiver capable of tuning the 70 cm ham band should be able to detect the signal.

Q Do I have to use a high gain antenna to hear the signal?
A Digitalker operation dedicates most of the power budget of the satellite to the FM transmitter, instead of spreading it across a mode JA transponder. It is a very strong signal! It is possible to hear the satellite with a handheld scanner or transceiver, and a stock "rubber ducky" antenna. Most 70 cm base stations, or scanner listening posts, with fixed antennas, should also be able to tune the signal.

Q I've heard that a circularly polarized antenna is necessary to hear FO-29. Is this true?
A While a circularly polarized antenna will help on mode JA, it is

not necessary with the digitalker. It REALLY is possible to copy the signal with a handheld device and a "rubber duck" antenna. We have been successful with a Yaesu FT-50R and a stock antenna. You will need to rotate the rig (and antenna) for the best orientation. Experience shows that horizontal polarization, with the axis of the antenna perpendicular to the satellite gives the best reception. Experiment!

Q Where do I tune to hear the signal?
A The transmit frequency is 435.910. Of course, you will have to compensate for doppler shift. Just remember you will tune a little higher in frequency as the satellite approaches your position, and a little lower in frequency as it recedes. You will always be tuning higher in frequency when the satellite comes over the horizon. Make sure you have your radio set to tune small increments, as increases and decreases in doppler are gradual, and linear.

Q How long will I be able to hear the satellite during each pass?
A Since FO-29 is a low earth orbit satellite, most passes will be between 6 and 18 minutes in duration. Timing is critical in working any amateur satellite.

Q What is the purpose of the digitalker?
A The digitalker presents an easy opportunity for hams and non hams to have their first taste of real time reception of signals from space. Use this opportunity to show a kid, or a terrestrial ham how easy it can be to tune a satellite. This opportunity is excellent for scout meetings, monthly ham meetings, schools, or any place where nquisitive persons congregate.

Q How will I know when the satellite is over my location?
A You will need a program to generate predictions of when the satellite is "visible" to you. An excellent place to find downloadable software for real time tracking of satellites, and other information on the amateur satellite program in general, is:

http://www.amsat.org

Be sure to download the latest keplerian coordinates if you download a tracking program. Each prediction program needs these coordinates to determine where the satellites are, and to help you determine when FO-29 will be over your horizon. Another casual approach, is to use an online prediction site, such as:

http://acsprod1.acs.ncsu.edu/scripts/HamRadio/sattrack

This site will generate pass predictions for a selected satellite.

If you have any comments, additions, or modifications to this document, please contact me directly. We will attempt to post the latest version whenever the satellite is toggled to digitalker mode.

73, Mike KF4FDJ

This is a tremendous site for the talk groups, but, unless I am missing something, the actual frequencies of the system are not listed.

I understand there is an application that will allow me to input digitized audio from my PRO-91 to my SoundBlaster and it will decode it.

I live in San Diego County and virtually all services are trunked, which is no problem, but the Sheriff is also digitized.

Is there also a portable unit that will decode on the go?

Thanks in advance...

My pro-60 is noticably deaf in some areas as well. Unfortunately it lacks sensitivity in the 150-160 mhz. range where the local police ,fire and ambulance operate. For example, my Pro 46, a much cheaper scanner, will pick up both the mobile and base of the ambulance service within a reasonable distance but with the Pro-60, the mobile needs to be within a few blocks to hear it. The antenna is not the problem as I have experimented using different antennas with different scanners. I suppose there could be a problem with the Pro-60 but it was like this right out of the box.
David

In flight school they told us that AM was used because you could hear

another station underneath a strong siganl as a hetrodyne. And it was vital to at least tell there was another station. With FM, like you said the capture effect will eliminate the weaker signal.

4051. Current line of Radio Shack Scanners- How do they rate?

Newsgroup: rec.radio.scanner
Date: 1999-09-13 00:00:00 UTC
From: spamhater@nospam.com
Message-ID: <37dd1607.246678638@news.giganews.com>
Source record: 107101

I'm am seeking information about the current line of Radio Shack scanners. How do they rate? Can anyone point me towards a good site that does reviews and comparisons?

I am mainly interested in scanners for NASCAR races but wouldn't mind if they had additional features, bells and whistles.

What company actually makes the Radio Shack scanners? How do they hold up over the long run? Are they more or less fragile than Uniden, Relm, etc...? Are they more sensitive or better audio quality? Do they have better than average noise canceling or adjacent channel rejection? What's the most important feature they do or don't have? Any information anyone can add will be very much appreciated.

Thanks in advance!

-Gary

By "common scanners?" No.

However that doesn't mean the signal can't be detected by someone
else. Specifically, if you multiply the signal by 2 (or by 4 if
they're using QAM) at your IF frequency, you should be able to recover
the SS clock. Want to recover the spreading sequence? Easy. Just
perform a Walsh-Hadamard transformation on the incoming data stream.
I know that sounds very strange, but if you've ever messed with FFT
algorithms, you'll appreciate the Walsh-Hadamard transform. It's
actually easier to program.

Total signal aquisition time using these techniques could be only a
matter of a few seconds. It can be done and it probably doesn't
require more than a modified scanner with a baseband output, and a
laptop.

I wouldn't be surprised to learn that your friendly neighborhood spook
probably knows all about it.

First, it is not illegal to possess. It is illegal to manufacture or sell, and then only for an entity that conducts interstate business (remember the 10th Amendment and the Interstate Commerce Clause?) Private sales withing a state are legal. As for why they are "Communist" their action indicates support for an overly intrusive government policy that violates some of the freedoms this nation was founded on, and as such, while the label is simplistic, the concept behind its use is sound.

Hi all,

Eavsdroppers and it's members are looking for input from fellow hobbyists with regard to the Winflex pager decoder, we
have already made the line length 120 from the usual 80 giving a better display on long messages. The VXD's have also
been re-written.

We are also currently trying to fit a trafficmaster decoder into it but we are in desperate need of more info on this
one (map positions and message data format). We have had some success but will not release the TM version until properly
completed.

So if you have anything you want made better or added to Winflex please MAIL ME at ian@eavsdropper.dabsol.co.uk

and we will see what we can do for you all, keep an eye on the site for updates in the near future and I will try to
respond to all mail sent to me as quickly as possible.

thanks

Eavsdropper.

4063. What the heck is THAT?

Newsgroup: rec.radio.scanner
Date: 1999-09-13 00:00:00 UTC

Hello.

A neighbour (who I don't know) has erected an antenna(?) on his roof. It consists of a single mast with a white diamond on the top of the mast.
What type of antenna would that be? Or is it something else?
Thanks!

4064. Icom R1

Funny - I just stumbled onto that site a week or so ago. I don't know how long it's been up, but it's clear they didn't have Brian around to publicize it for them 8*)

These sold for $4.97 each a few months ago on clearance...

....and there are still around 300 out there unsold, still at
that price...

Make sure you program in order of the "logical channel number" LCN. This protocol dictates the order in which freq. are entered for GE systems.
Hope this helps, make sure you have the attenuator turned OFF as this will reduce sensitivity to nil.
Jack

4070. lat/long/distance question

Newsgroup: rec.radio.scanner
Date: 1999-09-13 00:00:00 UTC
From: David Wilcox <wilcoxdl@inwave.com>
Message-ID: <37DD67DA.ABD639E4@inwave.com>
Source record: 107120

Hi
Does anyone have or know of a place that i can get the code in VB6 or
VBA
that will calculate the distance between two lat/long coordinates. I
would like
to add this feature to a tower database, but am stuck on writing the
code to make it work
Dave

could be an old BSKYB sat dish, or possibly a hi-gain directonla terrestrial tv antenna ?, or many other things...post a
pic of it to alt.binaries.radio-scanner or to your web site and let us see :-)

I'm glad you live somewhere else, too, Colin.
I find your comments rather strange coming from someone whose country bans listening not only to cellphones, but to the police, fire department, ambulances, aircraft and boats. Follow the law in your country and the only thing you'd be listening to would be CB, amateur and broadcasters. BTW, do you still have to buy a license every year to watch television and listen to the radio?

Hey, how about supporting a frequency for the VHF/UHF crowd. I don't live in a hurricane area right at the moment, but some of us do (and I recently did). I'm sure there are those with only VHF/UHF capabilities who would like to communicate with the outside also.

4083. Re: lat/long/distance question

Newsgroup: rec.radio.scanner
Date: 1999-09-13 00:00:00 UTC
From: Charley Harp <charp@htonline.com>
Message-ID: <rtqv1khv1iv19@corp.supernews.com>
Source record: 107133

Hi, Dave,

Let's see if we can work this out from scratch:

For a spherical triangle whose sides subtend angles A, B and C from the center of a sphere, and having angles a, b and c opposite these, the Law of Cosines says:

```
cos(A) = cos(B)*cos(C) + sin(B)*sin(C)*cos(a)
```

or

```
-1
A = cos (cos(B)*cos(c) + sin(B)*sin(C)*cos(a))
```

Let the side A connect the two points of interest, (Lat1,Lon1) and (Lat2,Lon2), let the third point be the North Pole (90,0), and let the Earth be a sphere with a radius r=3958.7 miles. Then

```
-1
A = cos (cos(90-Lat1)*cos(90-lat2) +
sin(90-Lat1)*sin(90-Lat2)*cos(Lon1-Lon2))
```

and the distance D, from (Lat1,Lon1) to (Lat2,Lon2) along A is given by

```
D = r*A (A in radians) = 3958.7*A/57.29578 = 69.09235*A
```

```
-1
= 69.09235*cos (cos(90-Lat1)*cos(90-lat2) +
sin(90-Lat1)*sin(90-Lat2)*cos(Lon1-Lon2))
```

There are differences between programming languages regarding the permissible range of angles accepted by the trigonometric functions. In the language I'm most familiar with (don't ask) all angles must be expressed in radians, the SIN function accepts angles between -pi/2 and +pi/2 radians (-90 to +90 degrees) and the COS function accepts angles between zero and pi radians (0 to +180 degrees).

Fortunately for us in North America, those expressions usually are within the nice range, when coordinantes are given in degrees North latitude and degrees West longitude. If you want a world-wide program, however, you must test the angle expressions within parentheses and adjust accordingly. For example, for evaluating cos(Lat1):

```
aLat1 = 90-Lat1
if aLat1 < 0 then aLat1 = -aLat1
else if aLat1 > 180 then aLat1 = 360-aLat1
COSaLat1 = COS(aLat1/57.29578)
```

Two points: You only asked about distance. Often you would also be interested in the azimuth of view from one point toward the other along a great circle, but I didn't go into that here. Also, there is some error caused by assuming that the earth is a sphere. It's actually kind of fat-at-the-equator by a few tens of miles but, again, if you're only interested in North America, the mean value works pretty darn well.

Have fun!
Charley_Harp@alum.calberkeley.org

I don't feel like drilling holes into my new truck. I've generally held steadfast against on-glass antennas because of supposed poor performance but this time.....

Anyone have any good experiences with on-glass antennas OR can anyone recommend one? Thanks.

Absolutely. It is an Emergency Operations Network.

>:Licenced Radio Amateurs in the affected areas should

I was not suggesting a debate of legal issues Barry. Hurricane Floyd
represents a bonna-fide emergency situation. SWL's and other interested
parties may want to monitor 14.325 MhZ (USB) for ongoing two-way traffic
which could provide for both interesting and useful information.
The HWN is also an excellent example of Amateur Radio Public Service
in operation as a national resource of volunteer operators who give of
their time, effort and electricity {free of charge} to aide and assist others.

This is Amateur Radio's reason and purpose.

Regards - Joe

You want the Radio Shack Pro-74. It is designed for use at the track,
as it lets you group frequencies together along with car numbers.
Other features include 100 channel memory, 10 banks, 10 priority
channels, fast scanning, coverage to 960mhz (excluding cellular and
military air and VHF TV stations.)

I would like to see an option similiar to trunker where you
can choose the which pin your data is on. CTS, DSR etc......

This would be helpful for use with different decoder hardware.

Source record: 107146

Jake, this is just the info I was looking for. I don't know what "QAM" or "SS clock" or "Walsh-Hadamard transformation" means, but I do have a scanner with a baseband mod and a computer, and about 20 days to return this "spread-spectrum" cordless phone if I can figure out whether someone like me, with some hobby equipment but limited knowledge, can hear my conversations. I know that government agencies will always have a way to do it, but my primary concern is the curious hobbyist type, which is why I've always avoided the cordless phones. I am "up" enough on it to never discuss anything of importance or give out credit card numbers or the like. Thank you for your response, and any other info that you could provide would be appreciated.

I have seen on several web sites, including the bearcat trunk page that fairfax county police are using a trunk system. Where could I find information that lists all of the talk-group ids for fairfax county? I have not been able to get a clear reception on the frequencies that are being used (853.4875, 853.9625, etc.). What can be done to improve the reception on those frequencies?

Charlie

Low staffing costs? how about STUPID STAFF to begin with.

The manager and ast manager at our store quit to pursue another avenue
I hope their replacements are smarter than the 2 that left.

The 2 that left were liers to begin with..Ask if they have a certain cable
(which is RS Standard stock item) and get told that they never have
carried it and you are standing there looking at the cable you asked for.

Sheesh if their replacements are this stupid RS needs to close their
doors

In excellent condition, comes with a belt clip, AC adapter and the original beautiful leather case in excellent condition.

Radio is very sensitive, a favorite of railroad engineers. Runs on eight AA batteries, very sturdy case.

For those who know how good this scanner is: Best offer over $150.
Offers taken until 9/15 8:00 PM PST

Thanks

Could be a bad high voltage supply. Try replacing C98 with a 47uF 25V
new capacitor. Don't take it from the parts unit. Older 300's used 22uF
for C98, but Electra changed to 47uF in later production.

Since I have no newsgroups for binary scanner files I
am requesting someone to assist me with the identifications
of an unknown coded or scrambled transmission. The file is
approx. 620k. If you think you can help please drop me an
email and I will send the file to you in WAV format. If you
can clear this signal, or this sort of puzzle fascinates you
as it does me please please assist.

Thanks
Chuck

The company makes a large percentage of profits due to low staffing costs.
The company's cheap so they can't hire anyone with a degree in electronics.
Do you really think you'll gonna get lots of technical info from a guy who
makes $5 an hour and barely pays rent?

Why don't you just buy a linear amplifier for your scanner. You know, you can never have too much power. Perhaps an "Echo Mic" would be pretty cool also. I know there isn't a mic input on your scanner, but I am sure you could wire one up.

Well I'm just relating from my experience in the Army while serving with a Field Artillery Unit. I spent about 2 yrs at Ft. Sill, Ok and almost 6 months in Saudia Arabia, Iraq, Kuwait.

We (while at fort sill) would "go to the field" about 1 week per month. Where we would more or less have war games and practice all the things that happen in a tactical environment. Just as if you were in a War situation. And part of this is communications security.

When I say tactical ops I mean communications from combat arms (active duty) units...ie infantry, armor, field artillery, ... I know that when I served, some ones ass would be on fire it they ever broke commo security. We observed communications security at all times while in these war games.. That is from the start of the event all radios used were of the secure type and no voice or digital traffic over an un-secure net.

I'm not sure what other units do... But I would imagine that all combat army and marine units will only communicate with secure devices and the only exception to this that I'm aware of is... range control or emergency traffic (medical or otherwise)

I was in a filed artillery unit Multiple Launch Rocket System (MLRS) and that's the way we operated and I assume that's the way they still operate.

If anyone that reads this lives near Lawton, OK (Ft. Sill, OK) I would guess that they would verify this.

I'm speaking from my past 89-91 and while I'm no longer in the Army and I don't live within range of an army post I assume that tactical communications by active duty units have and will remain encrypted in some form. Based on my experience having served with one of these units I've never heard of anyone transmitting in the clear dealing with tactical information.. ie locations, movements, move orders, fire orders, I've spent many hours pulling duty in a TOC (tactical operations center) an APC with 4 or 5 radios going at the same time ...from brigade down to the unit level.

What I said is "tactical ops" that means those very people who practice their job (killing them before they kill us). I sure hope that you are not hearing these types of msgs on military freqs. All combat arms units that I'm aware of have strict communications security regulations that relate to the security of the physical radios, encryption devices, encryption related material, and the use and operation of the radios and freqs. If you want to get into

trouble very quickly violate one of the communications security
regulations....

I would like to hear from another person who may have served in a
combat arms unit... I would bet their experience is similar to mine.

Well, when posters from those countries enter the fray, condemning the freedoms we hold dear in this country and advocating their curtailment, and also resorting to personal attacks, then it begs for rebuttal and response over the same wide forum. Just like with the "Are all scanner owners the crimal type?" thread, there's always someone eager to condemn our system, then turn around and complain when someone responds.

Hi Michele,

I don't know of a store in Colorado but you can order it over the
internet at

http://www.national-electronics.com/unbc.htm

I just ordered and received one from them. They are in Kansas and
they have them in stock for $209.00. They will ship them ground, 2nd Day,
or overnight. You would probably get it ground in 3 days.

They have coded the page with java script and they have prevented people from
right clicking on their web page in a vain attempt to stop people from copy their pictures and links. Who ever runs that site is a control freak.

4137. Older model BC950XLT - User Manual

Newsgroup: rec.radio.scanner
Date: 1999-09-14 00:00:00 UTC
From: Jeff Pajor <pajor@descent.net>
Message-ID: <rtsslguo1iv57@news.supernews.com>
Source record: 107045
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hello,

I picked up an older 950xlt from a friend and it doesn't have a users manual. I've also had very little luck with finding one on uniden's site, no pdf's or anything about the older scanners. Also, their customer service and parts departments were basically useless. Just wondering if anyone knows of a location for one in some kind of electronic format or where I could obtain one at a reasonable price.

Thanks,

Jeff

Let's face nothing. I suppose you believe they watch every move you make,
too.

Do you think they are invincible or something?

Without proof, your claims are meaningless. No proof has been stated that
there is any algorithm out there to hack ANY encrypted codes. Not just Spread
Spectrum. Why? Because there are none.

The ONLY way they can do it is with brute force and continually trying codes.
Problem is, that could take (at best) hours. Probably days. Then, when you
hang up the phone and make another call - they get to start the hack process
all over again because your phone has just, randomly, chosen a new encryption
code.

>All 900MHz phones are using chipsets that are
>produced in the millions probably and the code isn't all that hard to
>figure out.

If you understood the basis of encryption and how it works, you would
understand how foolish this statement is. It's meaningless.

>Trust me, 900MHz SS phones are a piece of cake to the govt.

Sorry, you couldn't be farther from the truth.

Do you even realize that the government used spread spectrum technology with
their own communications in their most recent overseas venture? Didn't think
so.....

Hi, Travis,

Hate to say it, but you are wrong. Pure and simple. Jake Brodsky is one of the consistently courteous, intelligent and ethical contributors to the scanner groups. What he described is not made-up technobabble. I didn't know how to do it off the top of my head, but clearly it can be done since your phone actually communicates to its base -- you think their clocks stay in sync that well?

I don't know what a Walsh-Hadamard transformation is either, but I do know what a DFT/FFT is, and it opened my eyes to how to demodulate an SS signal. And I have a good idea on where to find out about the other transformation.

The answer to the original poster is that SS is safe from the casual "nosy neighbor" listener but is not secure in the same way that encryption is secure. (Note that encryption and encoding are *NOT* the same!) Spread spectrum is "security by obscurity," nothing more.

Jeff,

As I recall, the 950XLT was a specially labeled version of either the 590XLT or 760XLT built for Communications Electronics Inc. in Michigan. If it has 800MHz coverage then it's the same as the 760XLT. If not, then it's the same as the 590XLT. You should be able to find manuals for the 590XLT and 760XLT at the Uniden web site, or call CEI at 1-800-USA-SCAN.

4143. Two antennas hooked up to One Scanner?

Newsgroup: rec.radio.scanner
Date: 1999-09-14 00:00:00 UTC
From: Andreas Mueller <muellera@kenyon.edu>
Message-ID: <Y2wD3.1938$34.228221@news.oh.voyager.net>
Source record: 107051

Hey Y'all I need your advice.

I have radio shack external magmount (20-032) antenna for my scanner when I am in the car (you know, the one with the two black things(not sure what they are called) that separate the antenna segments. Well anyway, this antenna was supposed to be allband more or less according to the packaging, however recently I have been trying to pick up on a new signal (856.2125mhz) and have found that the antenna does worse than the rubber duck that came with my pro-90 for this frequency. So I was thinking of hooking a Cellular antenna (magmount) up to my pro-90. However, I scan both this frequeny and lower ones (460s 150s and 39s) at the same time? Can I use a cellular and my old scanner antenna at the same time? Or will hooling up 2 antennas to my radio degrade performance. Also, which do you think is better, the radio shack mag mounts or the glass mounts? Do glass mounts form a ground plane?

Outsanding reply, and I concur 100%. I was also in the Army (Signal),
my job was a Field Radio Repairman, MOS 31E. I've also spent my share
of time as a COMSEC Custodian, and believe me, the Army takes
communications security very seriously....I was there when the Walker
spy ring got busted-imagine having to supercede classified
communications codes, callsigns, frequencies, you name it. Then I had
to re-issue new documents. All this before the end of the month turn in
of old stuff for new, page checks, destruction paperwork, issue
paperwork...very serious stuff.

I have heard Range Control and some light Helo traffic when the skip
is right, but you'll never hear a Battalion Commander directing his
command. Oh, the MP's operate in the clear...can be very interesting at
times.

You seem to be confusing spread spectrum transmission and encryption.
Spread spectrum is a way of transmitting information spread over a wide
bandwidth so that a conventional narrowband receiver (e.g. scanner)
can't receive it. But there may be no encryption involved at all.
Any receiver using the same chipset (e.g. another phone of the same model)
can receive the signal if it knows, or can guess, the spreading codes
used. If there isn't a large range of these, guessing might work.
Also, the handset and base have to agree on what codes to use for a
particular conversation, and they may negotiate these "in the clear",
which another receiver could hear and decode.

On the other hand, anything that is truly attempting to be secure will
use digital encryption of the data stream *in addition to* spread spectrum
transmission. GSM phones do this, for example. This requires using
keys that are based on some information available to the base and handset
that is *not* transmitted over the air.

In summary, if a spread spectrum phone is using SS just to avoid interference
and for some measure of privacy against common scanners, it probably
isn't using *any* encryption technology. Unless the documentation for
the phone explicitly says that they are using encryption, it likely
is not - and receiving it may not be difficult.

That's true, for good encryption. But encryption is not related to
spread spectrum transmission. You can have either one without the other.

Dave

"Digital" isn't the same as "encrypted". All long-distance phone traffic
these days is digital, but it's not encrypted so it's easy to monitor.
Digital pager traffic is digital but not encrypted. All traffic on
the Internet is digital, but little of it is encrypted.

And cordless phones, unless they actually claim to provide encryption,
are not likely to be encrypted either.

I'm not trying to split hairs on this thread...but its like you had to be there or have served in a combat arms unit to know what I'm talking about.

This kind of radio traffic never is transmitted "in the clear" or unsecure... never...ever....never!!!!

You may hear planes talking you may hear range control, you may hear medics, national guard units of various types, military police....

You will not hear tactial operations on an unsecure freq or radio....

The only type of unsecure equipment my unit had during the persian gulf war....was a set of about 6 commercial type hand held radios...somehting like you see police with or construction crews with. We used these to communicate outside of the military networks and for general use ...guard duty and stuff just particular to our battery. No sensititive information was ever passed using these radios..

Before you say that, put the phrase in a search engine and see what turns up.

QAM stands for Quadrature Amplitude Modulation. I use it all over the place at work designing and maintaining short haul T3 microwave links.

Look up Walsh codes. They're fundamental to Direct Sequence Spread Spectrum code selection. Walsh codes are basically the digital version of "frequency" in code space. Each Walsh code is orthogonal to the others.

A Walsh-Hadamard transform is very much like a code-space version of the FFT.

Basically the theory is that any code sequence can be represented as a series of Walsh codes. A Walsh-Hadamard transform can basically break these codes down so that you can see which codes are repeated most often. This is almost exactly the same concept as a square wave being represented by a series of sine waves.

But you don't have to believe me. It's in any introductory textbook on coding and encryption.

Take care...

Again, although the effort today is substantial and although it's
easier to merely tap the phone line on the pole, this technology does
exist.

I'm working on it now as a ham, trying to come up with good standards
for spread spectrum use in an open environment where the whole point
is to be able to tune in a spread spectrum signal as a public
broadcast. I have more reservations about the frequency hopping method
than I do about the direct sequence method.

Your cockiness about the security of coding is naive.

4155. Re: Military Freq Question

Newsgroup: rec.radio.scanner
Date: 1999-09-14 00:00:00 UTC
From: jtward01@aol.com.nospam
Message-ID: <19990914171411.09892.00000183@ng-xb1.aol.com>
Source record: 107063

Folks, I don't want to beat a dead horse here, but I have heard VHF lo-band communications that included ground units requesting artillery and air support at specific coordinates, a tank crew reporting a "kill" with a sabot round. Granted, I believe these were National Guard troops, but the original posting asked about monitoring military communications and the first response was that "all" military comms are encrypted and my answer was bull, that there are plenty of military comms still in the clear. If you don't believe me join Milcom, Commo and WUN, the e-mail listservers dedicated to military communications monitoring, and read the postings from the list members. 'Nuff said.

First the dangerous properties of those transmission lie in the carrier frequency, At over 800mhz, we begin to approach the micro-waves and their well knowned physical interractions with any water compound. (Microwave oven carrier is 2500mhz)

It not as efficient as an oven but, if you have the time...

I think that in a near futur, a direct link may be established between radio transmissions and a lot of diseases. Even at lower frequencies, the full bandwith simulcast we are in is a big experiment...

Wait for the scientific evidences, bye!

You will need to build a data slicer to interface your PC to your scanner.

Here is a great page with schematics and software:

Message-ID: <37DEC068.4C21AFA9@mindspring.com>
Source record: 107067

bought a pro62 for a few dollars.
when I first powered up and programmed it seemed fine.
however, after a few minutes the display shows 621 Mhz for all
channels. I have to disconnect the two piggy-back boards from the
display board and reseat (with power applied) to get it reset.

any clues as far as which direction i should take? (other than the
trash can)

>

NO. Not for EDACS. Motorola 800 or 900 is OK.

Moto systems tell their radios to tune to xxx.xxxx mhz. So this works in
this case.

But EDACS systems tell their radios to tune to channel x. That's it.

So if the data channel says goto channel 1 the scanner goes to the first
frequency in the bank and listens for a disconnect tone(or no carrier)
before returning to the data channel. So your method won't work on an EDACS
system. It won't track right.

The other problem with what you suggested is that the fleet mapping needs to
be the same if they are type I systems. Both E1-P10 for example.

Other than that, yeah, go for it I guess.

Hi, I would like to know how to improve the reception on my BC178XLT,
perhaps by making a different antenna...

The little two foot telescopic antenna that comes with the unit works
OK, but I would like to know if anyone can give me any ideas on how to
improve the reception, so I can PULL IN THOSE DISTANT STATIONS.....

ANY IDEAS ARE WELCOME,
THANX IN ADVANCE....
Bob.

From: Donald Young <dry220@worldnet.att.net>
Message-ID: <7rn3ns$9vh$1@bgtnsc03.worldnet.att.net>
Source record: 107080

For Sale:

I collect too many radios.

Uniden BC235XLT Trunk Tracker handheld scanner - comes with wall charger and rubber duck antenna - excellent condition - $165 (I bought the new 245XLT and don't need two Trunk Trackers).

Uniden BC 200XLT handheld scanner - comes with carrying case, wall charger and rubber duck antenna - while battery still holds a charge it is getting tired - could use a new battery - otherwise in very good condition - $65

Uniden BC 100XLT handheld scanner - comes with carrying case, wall charger and rubber duck antenna - needs a new battery as it no longer holds a charge - some scratches - note that it works fine if the wall charger is plugged in - $45

I have two Uniden 560XLT 16 channel mobile scanners - comes with dc power cord and mobile mounting bracket - both in very good condition - $50 each

Take all for $300! If you take all, I pay shipping. Otherwise $10 shipping.

Please contact via email - dry220@worldnet.att.net

Who says you have to have two way conversations to keep it legal.
Did you know that as an amatuer operator, in the States, you get to fly
model airplanes on certain frequencies by remote?
Also some radio clubs broadcast the Space Shuttle on H.F. and V.H.F..
It may be illegal in Australia but not here, dude
G'day matre

All the chipsets are common. They are not built to withstand military
style brute force hacking. They were designed to offer moderate security
but thats it. The phones are built, the government knows how they work,
it's certianly not beyond them. Of course the easiest way is just to tap
the damn line.

> >All 900MHz phones are using chipsets that are
> >produced in the millions probably and the code isn't all that hard to

Encryption is great if you are using a nice hard to crack code. Think
the phone MFR's are? They aren't. Check out www.jedefense.com for some
great articles. The Fed's and Military aren't going to advertise the
fact so don't be surprised you haven't heard much.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

For those of you in Vancouver Canada following the new
EDAC system, it looks like the Fire dpt has moved on to
the new system now. It appears that they still have their old
151.505 mhz system in operation, but who knows for how long?
According to a VFD member that I met, with his Erisson LPE-200
portable in hand, the new system still has "afew bugs" before total
conversion.
Older VFD memebers are not use to the trunking system of being assigned
a working
channel, with channel busy beep tones before they speak. :-(Oh well,
Things change!
For tactical comms they can switch over to a simplex channel if they
need to speak to thier chief.

Note: this system is also tied into the Vancouver Police department as
part of
the W.A.R.S program.
The BC Ambulance service is the next to go---Sometime in the fall or
early next year?

4178. shortwave radio, digital tuning, for travel

Newsgroup: rec.radio.scanner

Can readers suggest a small shortwave radio with digital tuning,
suitable for travel?

I know about Sony ICF-SW7600G and Grundig Yachtboy 400, both approx
$200. Which is better? Any others?

Are there discount sources online or via 800/888 numbers?

Thanks in advance.

Far more than what it is worth-R1 has exremely poor IF filtering, very poor rejection of unwanted signals. I wouldn't go more than $100.00

Any real reporter IS obligated to report. we do it because we like to get
PAID.

> Is Matt Drudge a
> reporter? IMO he is not, but even in the 'official' view it would be up in
> the air since he has no 'credentials' linking him to an 'established'

You got insurance? Real reporters have shield laws and companies that provide
insurance so that lawsuit doesn't come out of you pocket.

>
>
> Are they exempt from the law forbidding scanning cellular traffic?

Yes.

> Are
> they exempt from the law about divulging any traffic received on the

Because REAL reporters have sources that do all the dirty work for them.

>

Gee...
At the stations I have worked for one had the police make them buy the astro.

The photog staff found an officer that thought the media needed to have *all* the talk groups and let us borrow his H.T.. for 20 minutes. The P.D. was miffed...but didn't put our radios to sleep.

Leave the news gathering to the pro's.

Sam Donaldson will assume several new roles-including Internet Reporter-
as part of a new multi-year deal with ABC News. Donaldson, who is
leaving his regular White House beat but will continue to be based in
Washington, will report for all ABC News programs and will also do hour
long news specials. In addition, he will shepherd a new Internet report,
"http://www.SamDonaldsonABCNEWS.com," which will appear Mondays,
Wednesdays and Fridays at 9:30 am on abcnews.go.com beginning Sept. 27.
He will continue to co-anchor "This Week," and to anchor and report for
"20/20" as his schedule permits. Meanwhile, ABC has announced its
"20/20" lineup for this season: Connie Chung and Jack Ford on "20/20
Monday," Diane Sawyer and Charles Gibson on "20/20 Wednesday" and
Barbara Walters on "20/20" Friday. The new Thursday edition, to be
called "20/20 Downtown," premieres Oct. 7 with rotating hosts Elizabeth
Vargas, John Quinones, Jay Shadler and Cynthia McFadden. (LA Times)

All listeners can be assured there will be no HF contesters, no FRC,
PVRC, or YCCC members on board, and no restricted audio from 60 year old
men who sound like their BVDs are too tight.

There will be no firearms, Whacko, or Butch Reno discussions, no "59 Q R
ZED" comments, and no requests for 5 dollars to "QSL via buro". ARRL will
offer no pins for 5 dollars to commemorate this event.

Just hams actually doing something for a change.

Hi Toscano,

Thanks, I appreciate your looking at my e-bay auction. Sure wish I was in your area with 300 antennae's. Let us know where you are because someone probably would like to drive a couple hundred miles to get one. My area in Ohio has been cleaned out for many months. Also my local store told me they are now at $2.95 not $4.95. Of course they are out of them and will never get them again. When you are out of stock and will never have them you can clear them out at $1.00 and it wouldn't matter. Too bad because it is a real nice antennae. Thanks for the exposure, every little bit helps.

Rick B.

It actually stems from the very origins of the ARRL,
AMERICAN RADIO RELAY LEAGUE. When
spark tx stations were used to relay 3rd party traffic
across the continent. The tradition still follows to this
day with both the government and amateur operators
being disposed towards public service activities.

VK amateurs have a tradition of being lone rangers,
somewhat, and the acceptance of public service is
far less pronounced here. Derided, in fact.

Cheers, Bill. VK2GWG

Barry,

You're back to showing your ignorance again.

I don't know what is legal or not legal in your country, but this
net is in the northern hemisphere and covers several countries in
the Caribbean sea and North America. (Some other poster said
it is in the US which is only one of several countries involved.)

In all of those countries, the PTT and other regulators have
heartily endorsed this sort of operation by licensed amateurs.

73, Carpe Diem

Comparing using guns to listening to cell phone calls is a ridiculous analogy. You might be able to make a better case for comparing tsetse flies and Trafalgar Square!

> strange laws

Yes, they are strange in some ways. I can think of quite of few particularly weird ones that we acquired from our English forebearers!
>
> glad i live somewhere else

I like the UK and the English and I have enjoyed their hospitality on numerous occasions and hope to do so several more times. I can understand why you are glad to live there. However, I'm much happier to live in the US, thanks.

The freq counter won't lock on a single freq because the phone is transmittng
over multiple ones at the same time. It confuses the counter.

>I've heard that they cannot be
>monitored but I would like to get some confirmation from someone who is
>knowledgeable on the subject.

Rest asured that it can't be.

Don't make me laugh! The Fed's may not admit to it but lets face it,
they can do it with ease. All 900MHz phones are using chipsets that are
produced in the millions probably and the code isn't all that hard to
figure out. Sure there are over 600,000, but with the mil gear, all you
need is a fast computer to scan every code. Trust me, 900MHz SS phones
are a piece of cake to the govt.

Best place to start is the Scan-DC mailing list for scanner
radio-related topics in the Washington, DC - Baltimore area.
To subscribe to the list, send an e-mail message to:
majordomo@qth.net

and in the body of the message, subscribe scan-dc

You may view the archives online.

Point your web browser to: http://www.qth.net/scan-dc-digest.archive

If you just go to http://www.qth.net/ you can do a search on Fairfax,
which should produce lots of results.

Bruce in Blacksburg, Va.

How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was

permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and

store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS

(Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (828)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins

Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to

use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association

(RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want
to eat or drink, bring it with you, as well as your BBQ or
six pack.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig replaced a 22uF/35V C98 capacitor to repair his BC210XW.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855. email rlassoc@inav.net

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

HAMFEST/COMPUTERFEST CALENDAR 1999 - NORTHERN ILLINOIS
last updated May 10, 1999

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, Tom Harker, and ARRL for providing some of the information.

SEPTEMBER 1999

Sept 25, 26 (Sat & Sun), Grayslake, IL Chicago FM Club. Lake County fairgrounds. info: Mike Brost, WA9FTS, 5127 North Monterey Ave., Norridge, IL 60656-3245. tel. 708-457-0966 (the biggest and best hamfest in northern IL - AJ9S)

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer expo. The event is held on designated Saturdays from 9:30 AM to 3:00 PM. This show features computers, supplies, games, parts, software, accessories, CD-ROM, monitors, diskettes, printers, keyboards, modems, disk drives, cables, expansion boards, services, etc. Lake County Fairgrounds, Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall Building #1=9720,000 sq. feet. For a show map, exhibitor info, and discount coupon, visit the web site at http://www.ccxpo.com.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel

Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications
Corp. sells used Plectron receivers, in working condition,
for $75-100. If you require crystals or reeds, TCS may be
able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like"
signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and
ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.info,sci.electronics.repair

last changed June 11, 1998

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)442-2425 or (817)870-5600, or through your local Radio Shack store

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A crystal scanner are not working and the lamps for those channels won't light, replace IC4 or IC5 (type 7400A).

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Jan 1996 - Plectron & Motorola Alert Monitors
Feb 1996 - Radio Shack PRO-2042
Mar 1996 - Tips for Fixing Bearcat Scanners
May 1996 - Compendium of Scanner IFs
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters
Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)

Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500
Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T

hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using

green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts

of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great

searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses

custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact.

Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz

channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted

8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10

channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative

test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent

leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass,

AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz.

Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search

limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no

scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X		no	
FR105	6	X		no	
FR2512	24	X		no	
FR2513	24	X		no	
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been

replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard

or $34.95 for deluxe RadioMap report with histogram.
Include your name, address, and telephone number, along with
center location (nearest intersection of 2 streets, or
latitude & longitude) and mail to: Bob Parnass, 2350 Douglas
Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central
time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each,
but you must know the patent number. Credit card orders are
taken over the telephone by the Assistant Commissioner for
Patents at (703)305-4350. Alternatively, you can mail a
check or money order, made payable to "The Assistant
Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark
Office, call their automated information message system
toll-free at (800)786-9199.

There are various patent servers on the world wide web,
including IBM's server:

http://patent.womplex.ibm.com

4227. trunking scanners

Newsgroup: rec.radio.scanner
Date: 1999-09-15 00:00:00 UTC
From: Charlie Brookhart <cbrookha@erols.com>
Message-ID: <7rpm9iohg1@winter.news.rcn.net>
Source record: 106847

I was wondering if it is possible to monitor trunked frequencies on a regular scanner and what the reception would be like? Does the trunk scanner help keep the frequencies more organized.

With more and more communications moving to a digital trunking system, would a digital trunking scanner most likely be capable of receiving regular trunk transmissions?

Charlie

I carry credentials from Federal, State and Local agencies. The rule is with all the agencies is you must be involved in newsgathering as your primary source of income. If you are a freelancer you must submit your work for verification. Some counties require fingerprinting and background checks.
I don't get to cross police lines unless invited. But my press cards serve as quick visual ID to officers. The press card is not a right. Press cards serve as a starting point for other agencies (federal) when they issue special purpose and parking cards.

Walk into a "hot zone" with a mail order or homemade card and you will be questioned by members of the media(we watch out for our own)...then brought to the attention of police. Though it's not a crime to have a card that say's PRESS...It' is a crime to doctor a police document.

So what do you get with a real press pass???
The privilege of standing on a blocked street for hours waiting for the body bag.

The privilege of sneaking a few extra carry-on items on a plane.
The privilege of sitting 5 hours in secret service security lock down.
The privilege of maybe getting one block closer to the action that the public.
The privilege to get the card yanked if you break the conduct rules.

When you get you card you are saying you will abide to the rules of conduct listed on the card.
You get hit by a stray police bullet and you are on your own.

Former L.A. police Chief Ed Davis summed it up....
"The media has just as much right to die as we do".

Check with the local issuing agency to see if you meet this criteria.

Shhhhh....
Don't go telling anybody that 95 % of all the network shooters ARE freelancers!

BTW with all the stolen Betacams in the last few years the cops ENCOURAGE us to point out impostors.

So when Joe Blo shows up with questionable credentials just remember it's not a personal grudge....

I'm just protecting $60.000.00 worth of camera. My insurance company understands.

Actually, I was typing a little fast as Mark had me fired up and riled up
last night, but I think I used the term 'divulge' which it is ok to do
under certain circumstances when I should have used another term.

What I think is the crux of most of the laws is *profitting* from what you
here and I can't believe that anyone could argue that the media doesn't
profit from hearing such traffic, even if they do cloak it under the thin
guise of 'service to the community'. The bottom line is that if they
didn't profit from it, they would have to answer to their conglomerates
and advertisers.

In article <37DF90EE.E99FEC7A@mr.picker.com>, bwagner@mr.picker.com wrote:

|Markj wrote:
|
|> We are exempt from the reporting what divulging what we hear on cop and other
|> public safety frequencies. The test was in 1982 in Santa Cruz County, CA.
|> Sheriff Al Noren called the FCC and Attorney generals office and filed a
|> complaint.
|> Both Agencies refused to pursue it.
|>
|> I have no court cites to provide, but the A.G and FCC did not act on it.
|> The fact is...traffic reporters break the law every day...so does the press.
|
|Since 1982, a reporter HAS been fined for divulging intercepted radio
|signal contents. It was in Cleveland, and a reporter from a one TV
|station called his station to say he was following up a distress call
|from a boat on Lake Erie, to throw off a rival reporter from another
|station who he knew to be listening to his station's radio
|communications. There was no distress call, but the rival reporter DID
|intercept the signal, and called the Coast Guard to report the boat in
|distress. The Coast Guard came after the second reporter for making a
|false report, and he in turn pointed to the first reporter, explaining
|the circumstances. The first reporter was never charged with anything,
|but the second was turned over to the FCC, which fined him for divulging
|the contents of intercepted radio traffic. However, it is important to
|note that there is a difference between divulging the contents of a
|transmission and divulging facts learned by following up on the contents
|of the transmission. If a traffic reporter hears a police transmission
|of an accident, then flies his helicopter to where he can see the

|accident, and reports on it, he is not divulging the contents of the
|transmission.

Source record: 106949

The Media is not *obligated* to report anything and thus they should not have *any* rights the ordinary citizen does not have. Is Matt Drudge a reporter? IMO he is not, but even in the 'official' view it would be up in the air since he has no 'credentials' linking him to an 'established' media outlet.

Why can't I declare I'm an Internet Reporter and cover disasters and accidents and scan whatever I please without regard to the law? When trying to define a member of the 'media' you get into a dilemna sort of like trying to separate a cult from a religion. Is someone that freelances and submits 2 articles a year exempt from laws that I have to obey?

Are they exempt from the law forbidding scanning cellular traffic? Are they exempt from the law about divulging any traffic received on the business band to a 3rd party? If so, why, since they would be unable to report on it anyway?

Such arrangements as the one at the paper I worked at where the local police department bought them Moto Sabers and furnished the crypto for them puts them in debt to the police department, fosters an elitist attitude, and makes them whores instead of public servants.

My understanding of microwave towers and health hazards is this:

Scientists have said there is *possibly* a risk associated with mobile phone towers, but they have yet to see any cases of these health hazards in people. Therefore, it has not been proven yet whether they actually are a health hazard.

This one item (obligation to report) alone is completely and utterly and provably false without even addressing the remainder of your posting. Name one item that any newspaper is 'obligated' to report and name the authority that 'obligates' you to report it. School lunch menus? Rotary Club meetings? High school football games? Presidential elections? You are not obligated to report on any of these. I forgot--you are obligated to provide the little box that says who your editor and publisher is and what your circulation is.

Newspapers work solely on the principal of $$$ and not on altruism. There is no controlling authority that obligates you to any standard. You are even trying to charge the bereaved to publish obits.

Perhaps you missed the part where I said I worked for a newspaper for 13 years. Perhaps I forgot to mention I that I worked in more than one department? I know how they operate and what the impetus is, and the impetus is *NOT* community service.

I lied--I will address another couple of points:

Perhaps you resent Drudge so much because he points up the fact that anyone who works for the editorial department at a newspaper is nothing special and requires no license or education or certification or scruples or standards. The insurance issue is a non-starter.

|
| Sam Donaldson will assume several new roles-including Internet Reporter-
|as part of a new multi-year deal with ABC News. Donaldson, who is
|leaving his regular White House beat but will continue to be based in
|Washington, will report for all ABC News programs and will also do hour
|long news specials. In addition, he will shepherd a new Internet report,
|"http://www.SamDonaldsonABCNEWS.com," which will appear Mondays,
|Wednesdays and Fridays at 9:30 am on abcnews.go.com beginning Sept. 27.
|He will continue to co-anchor "This Week," and to anchor and report for
|"20/20" as his schedule permits. Meanwhile, ABC has announced its
|"20/20" lineup for this season: Connie Chung and Jack Ford on "20/20
|Monday," Diane Sawyer and Charles Gibson on "20/20 Wednesday" and
|Barbara Walters on "20/20" Friday. The new Thursday edition, to be
|called "20/20 Downtown," premieres Oct. 7 with rotating hosts Elizabeth
|Vargas, John Quinones, Jay Shadler and Cynthia McFadden. (LA Times)

A third party leaked the pentagon papers to the press...deep throat is a third party.
Third parties leaked the recent Waco info...

We don't hide behind third parties...we depend on them. Third parties are the only source sometimes. That is why my state and others have shield laws.

I can confirm the same thing.
During Operation Allied force, as not all the nations involved had the same encryption devices, they had to carry most of the comm on the clear. I heard several time co-cordinated given by AWACS to a/c.
I live in Italy and I followed that war every nite on my scanner. Callsigns involved, B-52 requesting lower Flight level because of door open and live missile problem, making their way back to England, F-16 unable to release live bombs, etc, etc.....
Hope this helps.

We are not exempt from ECPA. I must have typo'ed that. My mistake.
We are exempt from the reporting what divulging what we hear on cop and other public safety frequencies. The test was in 1982 in Santa Cruz County, CA. Sheriff Al Noren called the FCC and Attorney generals office and filed a complaint.
Both Agencies refused to pursue it.

I have no court cites to provide, but the A.G and FCC did not act on it.
The fact is...traffic reporters break the law every day...so does the press.

The news gods have smiled on us...for the public good.

The scanner IS NOT illegal to possess. It's as illegal as your pre-cable ready VCR that picks up channels 70 through 83. (cellular freqs)

They're commies because they don't want to deal with the horrible "electronic stalker" that everyone knows we are.

Almost true. There is ALWAYS encryption.

>Any receiver using the same chipset (e.g. another phone of the same model)
>can receive the signal if it knows, or can guess, the spreading codes
>used.

No different than any computer being able to decrypt any signal that it receives. It just needs the correct key (ie - it's impossible).

>If there isn't a large range of these, guessing might work.

That's all you can do - either guess or use brute force (basically the same thing).

>Also, the handset and base have to agree on what codes to use for a
>particular conversation, and they may negotiate these "in the clear",
>which another receiver could hear and decode.

Not true. The base and handset must be synched up by having the handset placed in the cradle - then they synch up physically - not over the air.

>In summary, if a spread spectrum phone is using SS just to avoid interference
>and for some measure of privacy against common scanners, it probably

They all do.

>Unless the documentation for
>the phone explicitly says that they are using encryption, it likely
>is not

What kind of statement is this? Spread spectrum insinuates that they are using encryption.

> - and receiving it may not be difficult.

Ok. Then go ahead and decode it. Pick a phone. Any phone. The point is that it cannot be done TODAY. By anyone.

>>>All 900MHz phones are using chipsets that are

Since 1982, a reporter HAS been fined for divulging intercepted radio signal contents. It was in Cleveland, and a reporter from a one TV station called his station to say he was following up a distress call from a boat on Lake Erie, to throw off a rival reporter from another station who he knew to be listening to his station's radio communications. There was no distress call, but the rival reporter DID intercept the signal, and called the Coast Guard to report the boat in distress. The Coast Guard came after the second reporter for making a false report, and he in turn pointed to the first reporter, explaining the circumstances. The first reporter was never charged with anything, but the second was turned over to the FCC, which fined him for divulging the contents of intercepted radio traffic. However, it is important to note that there is a difference between divulging the contents of a transmission and divulging facts learned by following up on the contents of the transmission. If a traffic reporter hears a police transmission of an accident, then flies his helicopter to where he can see the accident, and reports on it, he is not divulging the contents of the transmission.

A four level data slicer can be made to work with Trunker, but it consumes a huge amount of computer resource unnecessarily. The program is meant to work with a two level data slicer and there is no benefit to using a four level circuit.

>Ambulance Chaser, and a casual observer with a scanner? Is there one?

I've always thought that the "official" meaning of Ambulance Chaser was a scum sucking lawyer who chased accidents to get clients.

>I've heard alot of bad things said about "Ambulance Chasers" but who's to
>say the guy who stands there gawking at the scene isn't a reporter of some
>kind?

Who knows? Nothing wrong with standing out of the way and observing with your scanner. (key words - "out of the way")

In my city, I frequently take my scanner and video camera to "major events". The most I've ever had happen to me was I had a cop ask me to back up a little because they were putting up tape for a crime scene. He was polite about it. I bet they tend to be a little more cautious when they know cameras are present. I'm not on a first name basis with any of the cops or anything like that. They probably don't even know my name other than "that guy with the camera and scanner is here again". I don't cause problems.

>And even if he's not, provided that said call chaser stays out of the
>way, is there really any harm done?

Depends on what he does with any info he heard on the scanner.

>What makes him any better or worse than
>the rest of the looky loo's who gather to watch? Does having a scanner at a
>scene make you a loser with no life?

No. It makes you a focal point where everyone gathers around to hear what's going on.

>How is sitting at home and listening any different?

You get to see what's going on! ;)

>So, in your own words, what is an Ambulance Chaser to you?

I already gave my interpretation of it.

You know, recent surveys have shown that americans have somewhat less regard for Journalists than they do for attorneys and lawyers, in terms of the levels of honesty and ethics they expect from them.

Coincidentally, the journalism industry gives it's own members more awards than any two other industries in America combined.

Kinda makes you think, doesn't it?

The best is a direct wired antenna, with a good mounting place, i mean on top of
the vehicule.
An antenna with a kind of elevation rod under the whip may do well on a trunk
too.
Look for a sturdy & durable antenna or you gonna be in for shopping again soon.
Now the maximum DB gain allowed is 3 db, but at the beginning some 5 DB antenna
where available.
I think i have one trunk-mounted left, e-mail me if you're interested.

Once installed, very few people do this, ask a tech to test and set your antenna
for the lowest SWR (Standing Wave Ratio), that an adjustment wich may improve
the matching of the antenna with the transmitter.

Look for the longest antenna without enclosed coil on the whip.

Antenna is more important than the power output of the transmitter, between
extra-power or the best-antenna, i will choose first the antenna then both!.

Jean-Pierre

4281. Bearcat 210xl led light not working

Newsgroup: rec.radio.scanner
Date: 1999-09-15 00:00:00 UTC
From: Rick <rbulea@erienet.net>
Message-ID: <37DFD394.7345@erienet.net>
Source record: 106989
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Can anyone advise me on how to repair the led readout on this unit? I can see the numbers while it scans but they are almost invisible. I also see there is some kind of bulb or what I think is a bulb as I look at it from the back with the cover off. Could this need replaced & where could I find one. The scanner works great other than this so I would like to fix it if I can.

All help appreciated,
Thanks, Rick B.

Fully functional Uniden 800XLT base scanner (do a search to get all the details if you are interested). Full 800 MHz coverage, air, VHF, UHF. $80 plus shipping (probably $10). This unit is in good condition and will give you a lot to listen to. Research this newsgroup to get info on the 800.

4283. Antenna

Newsgroup: rec.radio.scanner

Message-ID: <37DFD11C.AE2EB263@the-spa.com>
Source record: 106991

Anyone have any opinions on the telescoping antenna that radio shack sells for use with handheld scanners? I believe it is 1 /4 wave with a loading coil on it. I was wondering if it would be 'better' ie better reception in general (being adjustable in length and all) than the rubber duckie that comes with the Pro-91? And what benefits are there to having a loading coil on the antenna?
-Chris

I don't have the details, but I remember that the original discone as
on the market before RS had a 10M element. I didn't think it
was 6M.

Someone once told me you could order it from RS, and then just
bolt it on and transmit 10M, but I don't know how true that is.

The best thing to do is to order the vertical element for RS's current discone
from Radio Shack Unlimited 800-THE-SHACK. It cost about $6.00 and fits right on top of the older models.

Message-ID: <01beffa6$b612ec20$884c1fd0@c541pc27.paccar.com>
Source record: 107003

FRS has 14 channels in 25khz steps from 462.5625 to 462.7125 and 467.5625 to 467.7125.

One of the rules governing FRS is that no transceivers are to be capable of an external antennas. You are limited to 500mw (1/2 watt).

If you need more range you should look at GMRS, which uses some of the same freqs (but a 2 watt limit) and also 462.550 to 462.725 in 25khz steps and repeaters are allowed and 50 watts of power. You will need commercial grade equipment.

The license is about $85 and is pretty easy to get. If the equipment $$ is too scary, try auctions or other sales for used equipment.

I have a GMRS licsense, a repeater, and about $10,000 in my system. I also have worked in commercial radio for a long time so it seems a little easier to me, I guess. Hope that helps.

Source record: 107005

FRS was specifically designed to be low power...hence the FCC rules include the provision that the antennas must be permanently attached to the radio (not that this is gonna stop someone from bypassing that, but...)

There's a good site on FRS & GMRS (they share some frequencies) at http://www.gmrsweb.com/gmrs.html especially the FAQs at http://www.gmrsweb.com/gmrsfaqa.html

The freqs are between 462.5625 - 462.7125, and 467.5625 - 467.7125. No repeaters, mobiles or "base stations"...just portables

If you can afford it, wait for the PRO-92. This nice little unit offers
CTCSS, plus many more items for you to try after you've spent 5 minutes
figuring out how to use CTCSS decoding.

Failing that, you can try to get the Relm handheld unit, it does it also.
There are others, but they cost a bundle...

BTW: Any new scanner user isn't complete without a visit to
www.strongsignals.net. Fix a big container of your favorite beverage and
visit that site - you'll be there for a while. Trust me.

The scanner page on Rich's site will also answer which handheld you should
get...check it out.

>|
>|markj
>
>Please cite me the authority that makes you a 'pro'? Or even legitimizes
>you at all as an individual journalist?
>

He gets checks in the mail, doesn't he? If I'm not mistaken, they are his sole source of income. Therefore he is a 'PRO' in that it is his PROFESSION. Being a PRO in the news business is far from easy. If you aren't good and don't produce on a regular basis you won't stay PRO for long. (Unless you don't mind starving or living in your parents' basement.)

You also are a PRO at what you do. Be it nuclear physicist, veterinarian, soap opera star or fry cook, you are a PRO at what you do. It is your PROFESSION, and apparently pays you enough to pay your electric bill, your phone bill and pay for a computer. So see? You too are PRO.

Cut him some slack. He did you a favor. He's telling it like it is. I know this for a fact. I have tried my hand at news gathering myself - albeit not as a full time gig. It's not as easy as you think. You get a big ration of crap from the full time staffers who think they are Gods gift to news. You get screwed out of your video because they say they are doing you a favor by just taking it in the first place. I've had that happen twice. They didn't tell me they weren't paying until AFTER they dubbed it for their own use. I do things differently now. You dub it - you bought it. Sign here please. OK now let's look at the tape.... and so on.

So I know what I'm talking about. Mark will agree. They will smile in your face while they stab you in the back. This I know. You have to go that extra mile to sell the story. You have to create shock factor for an audience that's seen and heard it all. You have to create the aura of "oh my god.." or the news agencies just look the other way. You have to make yourself so valuable to them that they would be lost without you. Otherwise, they'll just find another wide-eyed naive kid to take your place.... for less money. Or even no money.

Did you know that news stations across the country employ interns? Interns are students who need experience desperately. So desperately that they have to work for free to get it. How's that for "nice"? So if someone graduates to the ranks of PAID media, that says alot about what they had to do to get that far.

Huh? Since when is it illegal to possess such an item? It is illegal
in the UNITED STATES to MANUFACTURE them, but possession? You need to
learn the meaning of "banned." Next you'll be telling us that it is
illegal to own AR-15s because they were "banned" in the US....

Geez...

Hi

I think that Javiation (UK) can mod it so that the backlight remains on (as an option). Useful when using with an external power supply.

Regards

Carol

Source record: 107015

Jonas D. <Dj@nospam.com> writes:

>>Unless the documentation for
>>the phone explicitly says that they are using encryption, it likely
>>is not

>What kind of statement is this? Spread spectrum insinuates that they are
>using encryption.

No, it does not. Spread spectrum is simply a transmission technique,
that implies nothing about the presence of encryption or not. Encryption
can be used whether or not spread spectrum transmission is used.
Neither one implies the other.

For a non-phone example, look at the GPS (Global Positioning System)
signal. The entire signal uses spread spectrum transmission, but the
civilian part of the signal uses spreading codes which are fixed for
each satellite, and publically published. Thus, millions of GPS
receivers can pick up these spread spectrum emissions and decode them.

On the other hand, the military side of the signal uses spreading
codes that have been encrypted, so without the keys (which are loaded
into authorized military receivers) the military part cannot be
received.

>Ok. Then go ahead and decode it. Pick a phone. Any phone. The point is
>that it cannot be done TODAY. By anyone.

I don't have the resources to do this, but the question is not whether
I, or some random member of the public, could do it - the question is
whether people like the NSA can do it. If the phone uses good encryption,
even the NSA is going to have problems. If the phone just uses spread
spectrum transmission, without encryption, they just have to figure out
the spreading sequence in use - that's far easier.

Now, you claim that all spread spectrum *phones* also do encryption.
If that's true, why don't the manufacturers claim that on the boxes?
And how do the manufacturers get around the laws forbidding export
of devices that employ strong encryption?

Dave

The ICOM IC-R2 does ctcss very well. If you are new to scanning, I suggest that you get the programming software and cable (by ICOM); otherwise learning to program it manually from the manual can be a nightmare.
Happy scanning,

It's this kind of "Government knows what's best for me" mentality that challenges our personal freedoms on a daily basis. An item is made illegal with the stoke of a pen by some scumbag politicians and a bunch of gutless, spineless wimps accept it without question. Remember this is "supposed to be a FREE country."

Dear Oh Dear!!

The only good thing that will come out of this, if there is a health link established, is that all TV transmitters in the UK will have to be turned off because they operate a well over 500 K Watts per channel. About enough power as from the whole Cellular tower network in the UK off one Site. e.g. Crystal Palace London)

But suggest that maybe Coronation Street will have to go off will soon raise considerable opposition from the plebs who insist Phones are dangerous.

In Risk studies everything is potentially dangerous, the task is to identify how much and remove the worse cases so causing greatest reduction in hazard.

On this basis I thing Phone towers fall behind;

TV Stations
TV Receivers (lots of rays off the face plate
PC Monitors - same as TV's
Microwave ovens- as they age they may leak powerful energy
Aviation Radar
Speed Trap radar
....

BS

Sorry, forgot about those, but I would class them as a 'pointer' to an
advert as opposed to the advert itself, and IMO they are acceptable.

I have known Bud since 1981 and he is a staple of the SoCal newsrooms. He has broken more stories than most local reporters have. Too bad we don't have an award category for that.
Geez , long ago I got a call from him about a power outage in New York. he was listening on the internet and called me about what he had heard....I logged on and confirmed it. The I called my stations in Northern California.

We both beat CNN to the punch and our local stations ran the story at 11pm. Any time my camera and myself enter Southern California...I check in with Bud just to let him know that there is an extra camera in town.

Ambulance chasers...NO.
We usually beat the ambulance to the scene.

14.325Mhz is the ham frequency where they report weather data to the Nation Hurricane Center. Each state has seperate frequencies for their state nets, most are on 7.2-7.3 and 3.7-4.0 Mhz.

If you're in the effected area of course you can monitor the FEMA and state EMA VHF/UHF frequencies.

4333. HELP with suggestions for setting up an Antenna in Apartment

Newsgroup: rec.radio.scanner
Date: 1999-09-15 00:00:00 UTC
From: Bill <ftlosm@mediaone.net>
Message-ID: <rCYD3.16866$s%1.64438268@rmnws01.ce.mediaone.net>
Source record: 107041

HELP with suggestions for setting up an Antenna in Apartment

I live in a 2 story apartment complex building but on the first floor, I have hooked up my pro 2006 to the TV antenna wire thru a coax to bnc connector, I get pretty good reception for the low end but on the upper end 400+ of the dial signals are weak, for example on my handheld pro 21 with a small whip I can get better signals on upper end but I cant touch the signal strength of lower end channels vs. that TV antenna thru the pro 2006.

I have plenty of room inside as well as on my patio, I was wondering if I mounted something like a radio shack 20-044 antenna pg 95 of the 2000 answers catalog to the underside of my upstairs wooden deck mounted to a wood beam horizontally (no mast used aprox height 6 foot) if it would help reception issues on the upper end or if I would lose reception on the lower end.

To be quite honest I don't know the differences between a TV antennas capabilities or limits vs. a scanner antenna designed specific for full range listening, I just was hoping someone with more technical knowledge could fill me in a bit as to if I buy this scanner antenna will I help reception or basically just wasted my time trying it and also if I mount something like that indoors or horizontally without a mast will it still give me a decent signal considering those are my only real alternatives at the moment?

I know these antennas are designed to go high and onto a mast but in my situation it looks like it would be mounted inside on the wall near the window or on the underside of my balcony out of sight so management wouldn't complain.

thanks for any info or input you may be able to give,

Bill ;)

You could also build the 4-level slicer and disconnect one of the output pins to the PC so that only a greater than zero, less than zero indication is given. Add a switch to open/close that signal path and the 4-level slicer could be used with either two or 4-level programs.

I know this is only slightlly related to scanning, but I am posting it as a public service bulletin. For those who are in the area of New England, you may know that we will be hit by a Tropical Storm. If you are interested in the latest information including weather frequencies for your radio/scanner, storm updates, and (if I'm still online during the duration) latest local news brought to me via scanner (flooding, power outtages, street closings), radar, etc...they will be posted at my website. The normal website has been temporarily taken offline. According to the latest reports, we will have many power outtages and major flooding in New England. The website is

http://www.the-spa.com/chris.plath

The site is now up and running.

If you have any local New England news, you are welcome to email it to me at any time, I will post it on the site. You of course get credit. This is something I do whenever a storm threatens, year round, although usually I only do it in the winter for our NorEasters.

And webtracking on this page has been turned off, so no cookies will be set on your machine.

Glad to be of service!
Chris

I let my fingers overrun my brain when I was typing this and the context
got a little fractured. What I meant to ask was, that if I claim I'm a
reporter or a journalist (ala Drudge) and I'm needing to be at a crime
scene, for example, or an accident scene (ala Diana), how do I 'prove' I'm
a reporter to the authorities.

I grant you, a paycheck or an ID badge from a local media outlet would do
it for those who work there in the area. But if I'm an 'Internet Reporter'
or a freelancer and haven't bothered to send in my $11.95+S&H to order any
of those fake, generic ID cards out of the back of Soldier of Fortune, how
do I get my exemption from being prosecuted under the ECPA or the
ambulance chasing laws? (Note that no one has as of yet provided the proof
that even legitimate journalists are exempt)

I guess I could whip out my Domain Name Registration receipt from the
InterNIC -- yeah, that ought to impress Deputy Dawg or the humorless FBI!

Of course the problem is that journalists like Mark hate to to answer my
question because they (rightly IMO) don't consider Drudge and some
freelancers and paparazzi *real* journalists. And that leads to my
question of how do we and/or the public and the officials responsible for
enforcing the laws decide who is legitimate? The ones like Mark are easy,
but there's a huge grey area behind him.

Excellent point. I'm a Network Analyst only because my employer says I am.
Next week if they claim I'm a Wire Puller 3rd Class, then that is what I
am.

But ... I don't get any goverment exemptions from a nationwide law (ECPA)
for being a Network Analyst or a Wire Puller. The journalists on this
thread claim this exemption, so, IMO, they need some way of proving to the
government that are eligible for said exemption. Sort of like the
exemptions I've heard some local jurisdictions give to Hams to make them
exempt from the scanner-in-a-vehicle laws, I guess. Although, to be fair,
if you asked me to provide evidence of such exemption, I wouldn't be able
to do it, although my Ham license would provide the evidence that I'm
eligible for it. But for a national law it should be easier to find.

Mike,

Unfortunately, most of the scanners that cover the 225-400MHz military airband are top-of-the-line radios, not the economy versions. One thing you want to make certain is that you can select AM mode manually in the 138-150 range. There are a lot of military tactical communications between 138-144 and 148.50-150 that are in AM mode, and scanners automatically select NFM mode in that range. Many popular scanners that cover 225-400, such as the Uniden 895XLT, do not allow manual mode selection so are not really suitable for military monitoring.
If I were looking at setting up on a budget I would look for a use RadioShack Pro-60 handheld or a used RadioShack Pro-2045 table model scanner. Either should sell for $125 to $150 on the used market.
Other good scanners for military monitoring are the RadioShack models Pro-26, Pro-43 and Pro-2006; and Uniden's 2500XLT, 3000XLT and 9000XLT; plus the Sony SC-1. The RadioShacks are only available used, but the Uniden 3000XLT and 9000XLT and the Sony are still available new, although the Uniden's are over $300 each and the Sony is about $275.

I bought that 9.99 service plan on a pair of 14.99 headphones once. Of course I was giving them to my nine year old niece. That was X-mas last year she has made six trades for new headphones since then. For most people that plan may be a waste of money but if your giving something to a kid it may be worth it.

Given the relatively low power of a cell tower, the radiation pattern and the distance below the tower, risks should be practically nonexistent.

FWIW, my RS Discone has a 27" whip with a coil at the base. Back when
the RS Discone didn't come with a whip, I read about people putting an
ordinary CB antenna whip on the top of the discone.

Hope this helps.

Sorry Barry but I can't see that there is much difference really. Anyway I
suppose the NG Charter would give precise details as to what was supposed to
be allowed here. I must say that I personally prefer to see pointers for
commercial web sites and leave the NG for 'private' ads.

Yes, I've used one for 5+ years and it's very good for the price. In general, it will out perform the stock "duck" antennas on VHF, especially VHF-low (30-50mhz). At UHF and up, comparative performance would vary depending on the particular antenna it's compared against. The stock ant. on my PRO-43 works better on 460mhz, but some others I've tried are marginal. The loading coil electrically "lengthens" the antenna, improving it's performance at lower freqs. As Oklahoma still has an extensive lowband network for the Highway Patrol, and many smaller PDs still use VHF-high, this antenna works well for me.

Chris,

I've used one for the last three months on my Pro-60. Primary use is UHF milair, secondary VHF. Reception seems good (VHF, 150-155 seems about like the duck in real world), but quality is lacking, I've had two. (It wobbles on the radio). I suggest the Watson 889. Look at Strongsignals for a comparison. Pay the extra $, IMHO.

You don't say what you think is economical, but, I have bought both a used
Pro-60 $150 & Pro-2042 $240, through this group within the last 90 days.
Both like new. I was surprised with the handhelds reception, but, would want
an external speaker with the Pro-60 for base use.

i took along two of my scanners on a recent trip from Phoenix to Los Angeles.

I monitored the Clearance (118.1), Ground (119.75), Tower (118.7/120.7) Departure (124.1), Albuquerque Center (125.15/135.15), Los Angeles Center (133.2, 135.75, 125.45) LAX/Socal Tracon (124.3) LAX Tower (120.95/133.9) LAX ground (121.75/121.65)

the controlles did an excellent job of keeping the flight clear of storms....only experienced light chop or turbulance. briefly.

ther ewere no lengthy gate hold delays that is customary when you fly into either LAX or PHX

Some early "SS" telephones did not spread the rf out all that wide and
a Pro2004 would allow you to hear enough to understand what was being
said. The Pro2004 was switched to instead of narrow FM.
You might also want to look around for older military rceievers.
I have an unnumbered beast that tunes form 800 to 2500MHz and it has a
4MHz and 16MHz (reallly) wide FM mode. I suspect that it would work, but
have never tried it. I use it for SETI.

I have the following Radio, and electronic equipment for sale. Will consider trades for Hand held Scanners with full 800 coverage. All Gear working last time tested unless noted. Shipping is extra. Please reply to my email address. Thanks
EJ (KC5EPI)

All Tube Items:

Tempo-1: All Tube Ham Transceiver with Power Supply. Covers 80-10 meters. Looks good and works well. $200

Pearce Simpson: Guardian 23- All tube CB Transceiver/with mobile power cord and mounting bracket. Looks and works Good. $100

Channel Master: Tube Stereo Receiver (Model 6612) and matching amp (Model 6601) Looks good and plays on FM only. AM not working. $100

Non Tube Items:

HTX-202: Radio Shack 2 Meter HT. Works good. Slightly chipped where the battery slides in, but does not affect operation. No nicad, but I will include the AA Battery pack with the unit. $80

Marantz Model 2220B: 25 year old Stereophonic Receiver, with gyro-touch tuning, blue dial and optional real wood case. This unit is in excellent condition, both in looks and operation I would rate a 9.7. Also have original manual, in excellent condition. $200

AR Inc: Stereo Amp, All solid state. $100

Traynor: Group Two B- Audio Amp Head. High/ Low misc. in puts. Master volume, volume, bass, treble and tone shaper controls. All solid state $125

Swan 14X DC Power Supply Module: No way to test but was told it was working OK. As is $50.

Siltronix Model 90-6 VFO: Excellent condition with three position crystal switch $75.

PRO 2003 Scanner: Radio Shack 50 channel(30-512 Mhz.) Digital Scanner with FM broadcast band included. Have two, one is working the other is a complete non working unit. $150 for both.

Bearcat 250 Scanner: Have two. One working at times and one for parts. $50 for both.

4361. help: newbie wrestles with whether or not to get trunk tracking

Newsgroup: rec.radio.scanner
Date: 1999-09-16 00:00:00 UTC
From: nospam@all.com
Message-ID: <37e0cb85.158366826@news>
Source record: 106879
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hello folks. I'm new to scanning and am in that golden phase of doing the research before buying my first scanner. It needs to be a handheld unit.

I've read the FAQs and scoured Deja News. My dilemma is whether or not to get a unit that can do trunk tracking. So many police agencies use trunking that it starts to seem indispensible. I know you can switch frequencies manually w/ blocking, but that seems like such a pain, especially when driving.

I'm willing to spend between $200 and $300, so why the dilemma? Because I try to follow the AA rule with my portable comm equipment: "Thou shalt not buy comm equipment that can't run on alkaline or lithium AA batteries".

The new Uniden that handles both Motorola and Ericson trunking systems looks perfect... except for that damn battery pack. My ultimate scenario includes power outages and mobile situations, so being able to run in to 7-11 (or tapping into my personal stash) for some extra AAs to run the scanner is very appealing.

How have the rest of you dealt with this? Is trunk tracking truly so great that it justifies violating the AA rule?

TIA
Mike

Why do you have to? A reporter (ie civilian) has no more right to be at the
scene of a crime than you or I.

You'll notice on news reports that all the media is always BEHIND all the
yellow tape lines. Never inside it. Same as Joe Civilian.

Right...but as far as "special privileges" that others were griping about, you really don't have any. You don't, automatically, get to walk in to a crime scene and crawl all over a body for some good photos.

>Walk into a "hot zone" with a mail order or homemade card and you will be

When you say "hot zone", are you referring to any area outside the police lines? If so, I'd laugh at you if you started crying to the police. I have as much right to be there as you.

>So what do you get with a real press pass???
>The privilege of standing on a blocked street for hours waiting for the body bag.

Same as a person with no press pass at all.

Again, I as you - why do I need credentials at all to shoot pictures of a
crime scene as long as I am behind the tape?

Some cop better have sufficient probable cause before he starts asking me to
produce a receipt for a camera I'm using.

The only solution right now is to buy additional battery packs and
have them fully charged.

The newer RS trunktrackers (PRO-92 and PRO-94) may take AA batteries
when they come out in the next couple of months, you might want to
wait.

|And in addition, the ECPA of 1986 CHANGED the law, and it
|now specifically exempts law enforcement, government, and
|several other services from the laws on divulging.

Hi Bud:

Thanks for sending the copy of the ruling in the Gass case. Unfortunately
my Mac at home doesn't like the encoding of the attachment, but I was able
to scan it from work on a Yahoo account.

But, if I understand what I read correctly, this is still not an
exemption. This was just a refusal to prosecute. I'm no lawyer, but isn't
that quite a difference--given that the media folks have been claiming
they have an exemption?

I know that if I thought something I was doing was questionable under the
law I'd want a clear cut exemption rather than just a historical precedent
of just one case in which the violator didn't get prosecuted.

I'll read it more closely when I return to work.

>The new Uniden that handles both Motorola and Ericson trunking systems
>looks perfect... except for that damn battery pack. >>>>

Wait a little while and take a look at the "NEW" Radio Shack Pro-94 which uses 4 AAs or the "NEW" Radio Shack Pro-92 which uses 6 AAs. They should be on the shelves of RS soon and they do what the Uniden does and more according to the text in the 2000 RS catalogs.
If your city does trunking then I don't think you'll be very happy WITHOUT a trunk tracker type scanner. I visited a big city with trunking without one and ended up turning off the non-trunking scanner...
Hope this helps you a bit.

I know what you mean about the dedicated batteries, they drive me nuts, but there is a couple of solutions. If you are not in a hurry check out the PRO 92 in the new Radio Shack catalog, the scanner isn't available yet but is capable of tracking Motorola I,II,I/II GE/Ericsson and Johnson/Uniden. Also features SAME weather alert and uses 6 AA batteries this scanner is made by GRE and should be a winner. If you just want Motorola trunk tracking the Radio Shack PRO 91 uses AA batteries and it is on sale right now for less that $200.

|Why do you have to? A reporter (ie civilian) has no more right to be at the
|scene of a crime than you or I.
|
|You'll notice on news reports that all the media is always BEHIND all the
|yellow tape lines. Never inside it. Same as Joe Civilian.

Oh, there is no doubt in my mind that the media get access where a
'civilian' would be told to either get lost or thrown in jail. This is
because there is a symbiotic (I could have used an uglier word here)
relationship between law enforcement and media, a sort of dance of mutual
blackmail below the surface--each knowing they could damage the other.

But leaving aside distractions such as press passes, the only question I
want answered is why the members of the media who are posting here think
they have an exemption from the scanning laws that the rest of us have to
obey. You'd think that with their banks of megaconglomerate lawyers they
could provide an example of the exemption they claim, but never quite seem
able to produce.

I think no one has ever called them on it before. I asked my management at
the newspaper about it once and they were totally clueless. And are the
one who claim that ECPA 1984 granted them the exemption ready to concede
that they were breaking the law up until that time by divulging what they
heard on the airwaves for profit?

I agree that the ICR2 does CTCSS, but I disagree on buying it for that. It's small but as a primary handheld, it's a bother to use. If you go that route there's a freeware program available for programming the unit; a cable can be made or bought from someone who knows how to solder wires for at least a third of Icom's overpriced cable. A search on the Icom will turn up sites with the info you need. Start with storngsignals which others have already suggested.

The Pro92 would be a good choice too.

>blackmail below the surface--each knowing they could damage the other.

I don't believe this and let me explain why. I have a first hand account of a recent situation where the police screwed national media. Hundreds of them.

It was on the JFK JR. death. I live on Cape Cod and was out for a bike ride the day they transported the bodies to the hospital. The hospital is near my normal route, so I decided to stick with it and see how much of a circus it was.

When I got there, every possible news organization was there from all over the country. The police kept everyone back at the entrance road to the hospital. Reporters and me along with a bunch of other locals. No discrimination. The media had no story at this point, so they were trying to get opinions from the locals and whatnot to kill time.

The police would make an appearance every 10 minutes or so just to tell the media that the bodies would be driving by in just a few minutes and they would all get great photos. All the photographers started drooling over this (sick, isn't it?).

The police made 2 or 3 announcements like this and then they came out on their final announcement to tell everyone they could go home. Nothing to see as they have already left!!

The media was all bullshit, but what could they do?

I got to thinking and a smile came across my face when I realized that there is a rear entrance to the hospital on a small backroad. They must have quietly driven out that way!

Now, if that isn't the police directly screwing the media - I don't know what is!

>But leaving aside distractions such as press passes, the only question I
>want answered is why the members of the media who are posting here think
>they have an exemption from the scanning laws that the rest of us have to

I can't believe anyone truly believes this. The only "exemptions" may be the ability to have a mobil unit in states where this is forbidden or requires a ham license.

What about the amendments to the ECPA since 1984 that refute that? Maybe they should be a little more current.....

They use to make a 800mhz trunk coverter on witch converts the 800mhz trunks frequncies down to the 400mhz where you could pickup the 800mhz trunking but if you have a scanner thatis capable reciving the 800mhz frequncies in you would have lock out the control frequency and you have to listen to everybody that is on that 800mhz trunking system and with a trunk tracker scanner you can following each user on the truncking by programing the trunktracker with truncktracker codes.

Hello Carol,

The best thing to do is killfile "THE MAN". He has also posted as 911COMMUNICATIONS, 911RADIOCOMMUNICATIONS among others. At first I thought he was trying to be helpful, but very naive. Now I think he's just annoying (even if he isn't trying to be). And since his "value added" is a big ZERO, (which I see when others reply to him) I have no fear that I might miss something "important."

Carol Bain wrote:

Hi !

I have downloaded few different satellite trackers : LOGSAT, FOOTPRINT

WINORB.
All of these trackers show totally different positions of the same
satellites at the very same time. Which one to believe ?

Would anybody have a suggestion of a good satellite tracker which
follows satellites
the way they are positioned over the Globe, and a wow. or ftp site i
could download it from ?

I am using OAR 3000A scanner with regular whip antenna, will that be
enough
to receive any 137,xx MHZ satellite signals ?
I'm in NYC if that makes any difference.
I also have WX-SAT program do decode ?
Is that any good. I tryed to decode some signals on 4.762 mhz and 6.496
mhz.
signal strength was fine but nothing would show up on the screen.

I'm totally new to WEFAXing , any help ,I would greatly appreciate.

Thank You in advance
Phil

Joby Evans <jobye@ix.netcom.com> asked:
> What are the frequencies for the Georgia HERO units?

The Highway Emergency Response trucks use talkgroup 35440 on the
Atlanta trunk, with the dispatcher identifying as "TMC base". This talkgroup
is labeled "Information" on the standard list and is available to Atlanta PD
to call for a HERO unit. After the D.O.T. shuts down for the evening, SOS
units use the group as a Tac channel.

What was the airline? As far I know both Southwest and America West permit scanners on board *generally*. Still at the pilot's discretion, but I have yet to be told "No".

John,

Did the airline allow you to monitor ATC throughout all phases of the flight, or did you have to hide your scanners? If you had to hide them, how did you? I would think you would want to limit yourself to the frequency your aircraft was on at the time, but that would be difficult with a scanner stuffed in a duffel bag, or whatever.

Source record: 106911
Cross-posted to: rec.radio.scanner,alt.radio.scaner,rec.radio.swap

Ok folks. I know that there are a bunch of you that have a PCR-1000.
I'm interested in other software for it. Mostly what you think of the
3rd party software.
Is there any special features that you like better?
Does it do something that Icom's software doesn't?

Also, do you know of any tips or hints for better operation..... like:
Does grounding the unit really make a difference? I haven't done mine
yet.
Which antenna is the best for the PCR-1000? I use a discone.

Also.....does anyone know at what point the FCC made Icom redo the
PCR-1000 so that the simple eprom mod could not be done? Mine has a
serial number in the 1600's and it was modified. I seen another posting
where his was in the 1800's and it worked on his. Whats your serial
number (you don't have to say exactly)?

Do you have any other good information on the PCR-1000?
I'm compiling this to add to my PCR-1000 page. Its already up but I want
to make it a place where you can get all the information you need at one
stop. I spent hours just looking for what I have on it now and thats not
much. I would like to save other PCR-1000 users that time.

Are they all using the same orbital elements? If you are using the
elements that came as a default, then they will all be different.

You should pick up 'current' elements every chance you get, but
not more than a few weeks old.

Welcome to the wonderful world of computer operated scanners!
Being able to select which channels you want to record is one of
the many benefits. It will also log the date, time, duration, number
of hits, frequency, alpha tag (name assigned to the channel), CTCSS,
DCS, DTMF tones, etc. A few links below will help you understand
what can be done with these interfaces.

There are a few different combinations of scanners and interfaces
out there. My favorite is the PRO-2042 equipped with an
Optoelectronics OS535 interface and a PROgramit Interface.
I can scan better than 60 channels per second. The frequency
database is stored in the computer. The scanning program I use
is called Probe. It uses my database (1000's of frequencies)
to scan from. One disadvantage to the Optoelectronics interface
is it lacks the ability to program the scanner itself. While the computer
is running, the interface is controlled by the computer, where the
frequency database exists. When the computer is off, the scanner
no longer has access to the database and has no frequencies entered
into the memory. The PROgramit interface reads the database and
programs the memory so you will always have a current database
to scan whether you are using the computer or not. More info on
all these items below...

Another interface I use is a CE-232 interface with a PRO-2005
scanner. It only scans at the speed of the scanner since it doesn't
have a separate microprocessor, as the Optoelectronics interface
does. While it is slower, it does program the scanner's memory
directly. It is also setup more for the hacker as it has switches
on the interface that can be operated by software script.

Here are the links to get you started:

Optoelectronics Interfaces:
http://www.optoelectronics.com/os535page.htm
http://www.optoelectronics.com/os456litepage.htm

CE-232 Interface:
http://www.comtronics.net/0_oview.htm

Info on Probe Software:
http://home.ptd.net/~pro2006/probe.html

Rich Wells did a great review of the PRO-2035/OS535/PROBE
combination. That's essentially what I use. The PRO-2035 is
an earlier version of the 2042, which had some improvements

made to the firmware:
http://www.strongsignals.net/htm/rev2035.htm

Information on the PROgramit Interface:
http://www.qsl.net/ka2pyj/index.html

I also offer installation service for these kits.
http://dune.globe-net.net/~rc123/Robert/Services.html

If I can answer specific questions, contact me directly
and I will try to help you out.

You may want to look into obtaining a magnetic mount scanner antenna which you can place on a windowsill or on the balcony and maintain an unobtrusive presence.

Possibly look into a wide band discone type which can be mounted on the TV mast.

As for utilizing the TV antenna for scanning, in a limited fashion it has demonstrated to you that it is effective, if you don't use the antenna for TV reception you can turn the array on its side, so the elements are pointing up and down and this may extend coverage.

Experiment with what you have on hand or can obtain locally, some small changes can improve reception.

Good luck.

I have seen plenty of wannabes laugh and assert their god given rights...didn't change
a thing.
You see the cops in Northern CA. just tell you to "get lost" and if you fail to head
the order...they use the very broad "interfering" statue on you.

Keep an good media lawyer in your back pocket.

Of course it is, but that doesn't seem to matter to the panic merchants!!
Maybe they fear that the signal gets concentrated by the flat earth they
still inhabit.

4410. 900MHz phone is more secure Sony SS9101or Panasonic KX-TG2550?

Newsgroup: rec.radio.scanner
Date: 1999-09-16 00:00:00 UTC
From: extractor@cryogen.com
Message-ID: <37e16940.3766348@netnews.nyu.edu>
Source record: 106928

I know the analog 900 MHz phones can be heard with ease on a scanner. I wanted to find out which phone was more secure? Sony claims digital security using Spread Spectrum Technology at 900 MHz. Panasonic uses digital spread spectrum 2.4GHz from the base to the handset, but from the handset to the base it uses 900MHz. I read in this newsgroup before, the 900 MHz signal on the pansonic could be monitored with a scanner. Any opinion on these phones is welcomed.

Thanks

If you are an AR8200 scanner user, you should try out Gommert Buysen's ARC software. It is far better than any other 8200 software I have tried, including Radio Manager, ScanStar, etc. It costs a little more, but it really works!!

It is well done in almost every respect and works perfectly for me! AOR itself should buy a copy nnd learn what software is supposed to do and scrap that piece of junk they provide!

>explain probable cause to you.

OK. I have a question here. I am not a full time stringer, in fact I haven't even gotten my REAL camera yet. Right now I'm using my own camcorder until my betcam is ready for me to pick up.

But let's just say for argument's sake that you see me there, at the lines with the rest of the civilians, since I don't have (and don't really want) any press credentials. You see I am using a very nice camera - a bit too nice for average joe to use. Does that mean that because I don't have media ID and yet have media-like equipment I'm going to be pointed out as a possible thief just because I happen to be there? Is that what you are telling me here?

Does that seem a bit presumptuous to anyone else? Ok, sure.. probable cause - maybe I did steal it. But it's also possible and much more probable that I just happened to have that kind of money and free time to pursue such an expensive venture, and chose to spend it on a betacam. So how do you know? Hmmm?

I mean really. If someone stole a betacam, would he really take the time to learn how to use it, and then PARADE it in front of the police? This is beginning to sound like a story for America's dumbest criminals here. No,

the guy is going to sell it - and sell it quickly. Probably to a shady pawn shop or other fencing operation. You may find a stolen camera, but certainly NOT the thief who stole it. Chances are better that it will be nothing more than a big waste of time to the officer and a big F-U to the guy with the camera resulting in 2 enemies made that day.

Sitting there pointing at a fellow stringer and saying "I don't recognize him. That's probably a stolen camera, etc." is just plain petty. That officer is there to do something else and in most cases would rather get a root canal in Mexico than try to run a serial number on something as obscure as a betacam. Besides, if you are there to shoot a story, why would you waste precious time watching the other shooters? Shouldn't you be getting video as well?

Maybe I interpreted the message wrong, but considering the responses I've gotten from some full time staffers in the media, and the number of times I've been screwed by so-called professionals, I doubt I did. I would not put it past someone in that business to do something like this in some petty attempt to corner their particular market, under the guise of "watching out for their own".

Hello,

I picked up a RS Pro-2006 which clips very loud or borderline deviation signals. I misplaced my service manual and I am curious to know if there is a deviation adjustment for this. It does this in NFM and WFM modes. I remember a Murata ceramic filter mod but I am primarily interested in getting it to rx properly.. Tnx Prep

No...
Demeanor has everything to do with it...
If somebody shows of with a prosumer UVW-100 we really don't care.
If somebody starts breaking the written and unwritten rules of conduct then you will get the attention of the others.

Most of us have NO problem with new stringers...as long as they make a decent effort of learning the ropes first.

The attitude of *other* posters here would raise suspicion real quick from other media members.

We know what thieves are stealing...we also are much more alert to who belongs where because of the rash of equipment thefts.

>

We don't...that is why we ask who you are. If we think something is amiss...we check a little further, including tipping off the police.

>
>

Stolen cameras have a way of getting back into the U.S. better safe than sorry.
Most stringers that *are* serious about it ,take the time to say "hi' to us. I
will go out of my way to help a new person out when they present themselves as
willing "learn the rules".

>
>
> Sitting there pointing at a fellow stringer and saying "I don't recognize
> him. That's probably a stolen camera, etc." is just plain petty.

It might sound petty...but $60.000.00 in missing camera gear is not considered
petty theft.
A few quick friendly questions usually resolves the matter real quick...with no
feelings hurt, pro shooters (including stringers) understand why.

> That
> officer is there to do something else and in most cases would rather get a
> root canal in Mexico than try to run a serial number on something as obscure
> as a betacam. Besides, if you are there to shoot a story, why would you

You can't shoot much if you gear is missing.
Root canals are cheaper in Mexico.

>
> Maybe I interpreted the message wrong, but considering the responses I've

> for their own".

We work hard to establish sources and we can be very surly at times. That is
just the way it is. If some newbie shows up preaching all his so-called rights
as a media member...they won't get far. If we don't shut them down in the
field...we will shut the down at the desk.

The news media is still a very small family. We *do* protect our own. But there
is always room for one more member.

I live in a town with over 100,00 people and a police force that probably exceeds the national per-capita rate by about 5000%. I've been using an old Uniden BC200XLT for about, I'd guess, 10 years. Our police, fire and EMS recently converted to a trunking system... as near as I can tell there's not that much difference over the old system.

Every night at midnight, one of the channels becomes a "control channel" of some sort. That means that one of the channels (a different one each night) makes a loud continuous buzzing noise. I simply scroll through my channels until I find the one making the noise and L/O (lockout) that channel. I unlock the old "control" channel and I'm in business.

Never having had the luxury of a trunking scanner, I don't even know what I'm missing out on :(

Eric

As i remember, the way the law sits, it's still legal for individuals
to sell pre-ban scanners, it's just unlawful to operate them with the
intention of recieving cellular conversations.

Wanna bet? You most certainly DO need PC to be DETAINED. You are simply
amazing if you believe otherwise. You couldn't be farther from the truth.

Were you born in this country?

>Gosh...the supreme court just ruled that
>police don't need probable cause to search cars anymore.

You didn't read that ruling very well. Effective January '99, the police
CANNOT search a vehicle WITHOUT sufficient probable cause. As a matter of
fact, on a routine motor vehicle infraction (ie - cause of stop), the officer
cannot even ASK the operator for concent to search the vehicle. The officer
cannot even ASK for the ID of anyone else in the vehicle without sufficient

PC.

THIS is what was just upheld by the supreme court. Go look it up. I already have.

I find it absolutely amazing that you seem to spout off with complete inaccuracy.

>> Wouldn't stand a chance in a court of law in THIS country.
>
> Why would myself or some cops question result in any court action?

Jesus. Are you just trolling, or are you really this clueless?

When you violate civil rights to get your "results", the case gets tossed. Plain and simple.

>> Lemme guess - you spend so much time shooting the shit with the cops that you
>> feel qualified to pretend to be one now? Pffffft.
>
>Sure...

Thanks for clearing that up.

Amazing. Clueless and a liar! You most certainly DID say that if I was on
scene with a nice looking camera with no credentials that you would point me
out as a possible thief.

I've now realized that you don't have an ounce of a clue and are continuing on
with your psycho-babble just to be a pain-in-the-ass troll.

Welcome to my killfile, Jr.

The broadcast band for your home stereo FM is Wide-FM - Public service radios are narrow FM and Aircraft use AM as well as the CB band - They are just different types of modulation. Wide means a wider bandwidth so your music sounds good on the FM Broadcast Band - public service radios dont need high quality and it takes up less room in the radio spectrum - AM is used on aircraft becasue it can be heard at greater distances than FM - FM is a close range mode and AM is more for med-long range.

FM is created by slightly changing the frequency with the persons voice audio.
AM is created by changing the power output to the persons voice audio.

Not quite. The federal government has no power to regulate private party sales between residents of the same state within that state. That's how gun shows work without a waiting period, etc.; the sellers are private collectors. However, the minute a sale takes that scanner across state lines, national borders, or anywhere via the US postal service, then ECPA would apply.

THE MAN wrote:
>
> I heard the Coast Guard, today, on 8982.8 U.S.B. being called by
> Cheasepeake. How come I can only hear one side? Is there a frequency
> that I am missing?

Maybe. The Coast Guard's CAMSLANT (Communications Area Master Station Atlantic) Chesapeake uses 8983 and 5696 USB. It's possible you were hearing them simulcasting on both when the vessel/aircraft was replying on 5696. The other possibility is simply that, as always, conditions are not allowing reception of the other side.

You'll hear CAMSLANT because they are the fixed base, with high power and good antennas (though if they switch to a directional antenna that's not pointing at you, you may lose them). Whether you hear the vessels and aircraft depends on their location, power, antenna, altitude, etc.

For more information about Utlity monitoring in general, check out the free Worldwide Utility News club at:

http://www.wunclub.com/

and for >lots< of Coast Guard information in particular, see:

Ok, c'mon Mark. I did ask a valid question here, and you completely ignored me. You sound like a decent guy, really, and they don't just hand out those awards you have for the hell of it. So I would value your input on this, as you are a true professional in the news biz.

If I was to be standing there, with my betacam, but no media ID, what would you say or do? Would you really point me out as an "imposter" to the already busy police officers on scene? Or would you do the more logical thing and just get to work covering the event and act as though I didn't even exist?

I would just cover the event and then maybe chat with the other stringer later, ask how much the camera was, who he's sold to, etc. Get a feel for the guy - I would think you can usually tell who knows what they're doing and who doesn't. You never know, he might call you up one day and say "Hey Mark, I can't get to such and such scene, so I thought I'd pass on a tip...."

Of course I have two things going against me in this biz: I'm new at it and I'm also a pretty nice guy (so I am told)....;-)

One of Bill Cheeks' 3 books has info on how to realign the 2006. Check them out from your local library. If they don't have them they can do an interlibrary loan to get them for you. I seem to recall the procedure used the NOAA weather service transmission as a baseline and didn't seem too complicated. Good luck and good scanning.

Ahhhh.. So you mean by trying to get into crime scenes, beyond the yellow
tape, etc.
>
>Most of us have NO problem with new stringers...as long as they make a
decent
>effort of learning the ropes first.

God, I wish you guys lived in Phoenix. I've gotten maybe 2 positive reponses
out of the media here - and neither one actually paid me for my work...

>The attitude of *other* posters here would raise suspicion real quick from
other
>media members.
>
>We know what thieves are stealing...we also are much more alert to who
belongs
>where because of the rash of equipment thefts.

Makes sense I suppose...

>We don't...that is why we ask who you are. If we think something is
amiss...we
>check a little further, including tipping off the police.

Ahh there's the magic phrase. That's why I was concerned, because it seemed
like you'd just see me and go straight to the nearest cop. What you said
here clears that misunderstanding up.

>Most stringers that *are* serious about it ,take the time to say "hi' to
us. I
>will go out of my way to help a new person out when they present themselves
as
>willing "learn the rules".

Again, I wish you worked out here - you and I would become best pals... ;-)
Seriously, whenever I approach "pro" media they just look at each other like
"oh no..." I've been told the VHS best buy special camcorder I carry has a
lot to do with it, but still. Most of them have turned me down flat, without
even *LOOKING* at my work. The ones that have looked liked what they saw.
But getting them to look ain't easy for a VHS joe like me...

>It might sound petty...but $60.000.00 in missing camera gear is not
considered
>petty theft.

Now, what kind of camera goes for this much money, and why would you want
one? I've seen UVW100's going for between 7 to 9 thousand. Accessories going
for another 3 or 4 thousand. What does the 60,000 camera do that mine will
not? They both shoot nice pictures, that I know.

>A few quick friendly questions usually resolves the matter real
quick...with no
>feelings hurt, pro shooters (including stringers) understand why.

I would also, provided you weren't keeping me from the task at hand. ;-)

>You can't shoot much if you gear is missing.
True. At least not until the insurance check arrives right? (You have to be
kidding if you think I'm not insuring my camera against damage and theft..
and it's "cheap" by comparison to your gear.)

>Root canals are cheaper in Mexico.
For a reason. Root canals in the US have a much lower chance of killing
you....;-)

>
>We work hard to establish sources and we can be very surly at times. That
is
>just the way it is. If some newbie shows up preaching all his so-called
rights
>as a media member...they won't get far. If we don't shut them down in the
>field...we will shut the down at the desk.

See, hearing you say this sounds fine, but it isn't true out here. Out here
I *am* a potential news source and the desks could care less... I don't
purport myself to be a media member, and you'll find me back at the lines
drawn for any member of the public. Just with a camera in hand is all... If
a cop asks me to move, I move. If a cop asks me to leave I leave. I don't
even approach the scene without asking for a cop's OK first. I try to be as
inconspicous as possible, so that the fire and police personnel can do their
jobs unhindered by me.

>The news media is still a very small family. We *do* protect our own. But
there
>is always room for one more member.

Really? I wonder sometimes. There have been a few times that I was already
at a scene where the desk sent a crew. They tell me would rather set up and

shoot their own stuff after the fact than use my tape. Not even a look at it. Just the courteous (and sometimes not so courteous) "no thanks". Gee. How special...

Then other times where I sit at a scene, I film it, I document the details, I run it to the station, I watch it with them, they dub it and I waste a good half hour or more in the process while all hell is breaking loose on the scanner. Then they tell me that this is a "courtesy" (meaning Not Paid For) tape, and that's how they do things here. And I'm just supposed to smile and say "thanks, gee you guys are swell...golly, I'm gonna be on TV, yuk,yuk,yuk..."

NOT. So far my attempts at stringing have left me rather unimpressed with how you guys treat your "family" members...

Hello Everyone,

I have the following for sale. All items are in very good condition or better unless otherwise indicated. I would like to sell the indicated packages as packages unless I get a great offer otherwise. Below prices include CONUS UPS shipping. Payment by US Postal Money Order ONLY, and prepaid. NO C.O.D.'s, etc. Please e-mail directly to n3fvg@worldlynx.net if interested.

ICOM HF Mobile Package - IC-706 HF/6M/2M mobile with Icom AT-160 automatic antenna tuner, OPC-599 acc cable, Comet CF-530 HF/VHF duplexer and all related standard accessories, manuals and boxes.....$ 950.00

ICOM IC-03AT 220 Mhz. HT package - IC-03AT with BC-35 desktop charger, brand new BP-7S battery, BP-8S battery, IC-DC1 Mobile Adapter, Icom speaker mic, manuals, standard accessories and boxes.....$ 325.00

STANDARD C228A 2M/220 HT with CNB-153 battery pack, rubber ducky antenna and plug in charger ONLY.....$ 300.00

BEARCAT BC-3000XLT handheld scanner, 25mhz.- 1.3 ghz. (less cellular but will receive "images), rubber ducky, ac adapter and charger, battery pack just rebuilt. Includes copy of instruction manual.....$ 225.00

RADIO SHACK PRO-62 handheld scanner, 30mhz.- 960 mhz. (less cellular and 220 Mhz. band), with optional leather carry case, rubber ducky, alkaline batteries, and standard accessories in box. Only programmed, then put back in box, never used.....$ 150.00

MFJ-989C Versa Tuner V HF antenna tuner. No original box or manual but used very little. In excellent condition.....$ 250.00

KENWOOD MC-60A amplified microphone. In box, excellent condition, no manual.....$ 100.00

KENWOOD UT-28S 10M unit for TM-641/741/642/742 mobiles. Brand new in box, never used.....$ 260.00

(1) KENWOOD MC-44 microphones, 8 pin din plug, brand new in boxes, never used....(one sold - one left).....$ 25.00

KENWOOD MC-52DM microphone, 8 pin din, back-lit ttp, brand new in original wrapper, never used.....$ SOLD

DIAMOND MX-214 Duplexer (2M/220).....$ 45.00

MOTOROLA Montana 33.6 PCMCIA Cellular 33.6 Modem/Fax with cable for connection to Motorola Cellular Phone (Sold).....$ SOLD

Unknown brand HF SWR/Wattmeter, German mfg.?, says it handles 1KW but I wouldn't try it. Probably handles 300 watts, in box.....$ 25.00

(4) JOBCOM UHF handheld portables, 2 channel, 2W, 1 channel installed, 3 on same frequency, 1 on different frequency. Easily re-crystalled. With rubber duckies and plug in chargers.....$ 200.00 for set

MAXON VHF-hi , model CP-0510 handheld portable, 4 channel - 1 installed, with drop in charger.....$ 50.00

TERMS: PREPAID only by US Postal Money Order. Prices include CONUS UPS ground shipping.

A magnetic mount antenna needs a large metal surface under it. Not simply
for magnetically attaching it but also as a ground plane.

> I'm also a pretty nice guy (so I am told)....;-)

Based on your willingness to really LEARN about this business, I would probably introduce myself and HELP you get a better shot. Attitude IS everything!

Let me tell you why I get so defensive about this subject.
Personal safety and gear theft.

First on personal safety....
In 1993 I was at a nighttime swat incident where an armed and despondent man wanted the police to shoot him. The police had blocked off the neighborhood and let me into the closed area to take a position across the street behind a retaining wall. The standoff was in hour 7 when this "wannabe news hound" scales a fence behind me and makes his way to my position.

"Who the F&*# is this guy...I asked myself"
There was no way I was going to call anymore attention to my location...so I ignored the guy.

3 minutes later...our gunman is standing at a window yelling, the swat team saw this as a chance to enter through the front door. As the cops are moving up to the door....our little wannabe decides to turn on his (100 watt) camera light...calling attention to our position and endangering the entire operation

and many lives.

When the cops got the guy in custody...the swat commander detained the newbie for an hour under the interfering statue (never charged...just detained). He got a real good reaming and was detained long enough so he never got to sell any tape. I never saw him again at any events since the word went out pretty quick that he was trouble.

Myself and other crews have been placed in potential crossfire's because some guy new vidiot moved at the last moment for a better shot...forcing the police to re-position and endangering all of us.

We have problems with some of our own too.....
A photog (new hire) for a local paper made such a scene about his god given rights he got *all* of us booted from the area. He was fired the next day.

Theft......
Do a search for "stolen betacams' on the net...read the accounts and location where the thefts occurred. 3 cameras at O.J....4 at the Jackie O. stakeouts...we get followed home at night by crooks etc. Most of the pro's have gotten real good at checking SN# without the camera operator even knowing. It's only a 5 digit number.

If you take the time to learn...we will teach.
But if you act like another poster here (an ass) we (I) will do EVERYTHING in my (our) power to shut you down.
And despite what the other poster thinks...There is not one single law that will stop us from blocking shots...R.F.ing his camera...R.F.ing his wireless mic....or asking one of our may sympathetic cops to "run the S.N# on his camera and keep him busy for a bit because he is a threat to all of our safety.

Looks like Phil want's to learn...
Mr. Kavey just want's to argue about his so-called rights.

Who do you think has a better chance of seeing the action?

markj

Yes...I was way beyond the tape last night at a hardware and equipment rental store fire. I sold real nice stuff of exploding propane bottles. The public was kept 3 blocks away because of the toxic smoke. I have a real nice cutaway of the crowd with all their VHS cameras.

Believe it or not...VHS is a real pain in the ass for us. Most trucks don't have VHS decks and your camera has NO TBC in it...so feeding can take more time than it's worth.

Uh huh.. It happens a lot. I've seen this kind of thing happen myself. That's why I stay with the crowd, because it IS tempting to go for the shot, and in the heat of the moment, personal safety concerns go unhindered. I've caught myself a couple times being somewhat reckless and thought "Geez, that was really stupid..." So it happens.

But if you are back where the public is, then you minimize everyone's risk. So while the folks with the credentials may get a better view, I'll still be able to pull in something decent. The camera I'm getting comes with a 1x16 lens for just such an occasion ;-).

Of course the idea of stringing is to get the stuff that the staffers miss, at least that's how I see it. I find the stations are much more receptive to video of something they had no clue had happened than something that everyone already knew about. Most of the time, if I'm tempted to go get something, I'll listen up on the stations freq's and see if they are going. If they are going and it's just so-so, then I pass. No sense wasting the time or the gas... But if they don't know about it, I go.

Speaking of SN's is there any place online to check them? I know the gear I have coming is legit, but for future reference? I'll do that search also and see.

Thanks for the input Mark. I appreciate it.

-Phil

Well since no scanner on the market can pick up spread Spectrum; that
digital scrambling is going overboard.

You will first need to determine if any of the public safety agencies in your area use trunking. There is no need to have a trunktracker if you don't have any trunking systems to follow. I live in a rural area, Union Electric has a trunked system but our public safety agencies will probably never have it. I really like my Icom R2, and I can still listen to the UE boys if I want to. The number of channels also depends largely on where you live and what you want to listen to. I have approx. 50 channels out of 400 for public safety, this includes agencies in a six county area. The rest is mostly military aircraft. My 2 cents worth.

You know I am about as UNreligious as anyone can be, but even I fail to see the purpose in baiting others because their beliefs don't coincide with your own; unless it is simply to cause unhappiness ... or to draw attention to yourself because of your own poor self image.

If anyone has any explanation as to why this useless mick's remarks can be categorizes as anything better than hate inspired religion baiting, I'd be interested in hearing that explanation. In the interim we might keep this bottom feeder's post around as a textbook example of the dangers of allowing those suffering from Personality Deficiency Disorder to use some news groups.

You are the one who interjected religion into this matter, Mick! You compound the misdeed by seeking to harass and ridicule another's personal beliefs for no better reason than you are devoid of any respect for your own status in life. I wonder if you'd venture publishing such venom and mean spirited prejudice if the original author had couched his remarks in terms of other religions - Buddhism, Islam, Judaism or even Catholicism? You're the same kind of sicko who shot up the church in Ft. Worth earlier this week and are deserving of the same measure of contempt.

>rfenforcer@aol.com (RFEnforcer) Re:
>cellular towers a health hazard
......'How does a microwave oven work?
It heats the food by bouncing microwaves off of it'.......

Just a slight correction, food is heated by absorbing the RF energy produced by the oven. This is mostly the water and sugars in the food. Other materials, having little if any moisture (or sugars) absorb the energy because they are resonant to those freqs.

Since distance (also) from the antenna is critical to the amount of RF absorbed, the eye is something to keep aware of for possible RF heating by cell phone usage. Also, cancer is probably not the only ill effect (if it is reliably established there are
any ill effects).

Unfortunately, a lot of the research done in this country (U.S.A.) has been advocacy research, rarely impartial.

Anyone concerned, however, can find guidelines, recommendations, and regulations regarding RF exposure at

American Radio Relay League
www.arrl.org/

Institute of Electrical and Electronics Engineers
www.ieee.org

Occupational Safety and Health Admin.
www.osha.gov/

"Popular Communications"© magazine has printed several articles in the last year or so on this subject, all of which suggest erring on the side of caution at this time.

The first two and the last references are hardly fanatic anti-technology groups, and there is little or no reason to _not_ limit or minimize your exposure to high levels (whatever "high levels" comes to mean) of nearfield RF radiation.

From: copperhead007@my-deja.com
Message-ID: <7rs13l$7fg$1@nnrp1.deja.com>
Source record: 106795

I would appreciate any help offered here. I am something of a closet survivalist and I like to know what is going on around me. This would include LEOs, military, etc.. Radio Shack appears to be the easiest place to procure a scanner. They have their 150 channel trunker on sale for $179.00. Is this enough channels? Is trunking important? Having said that, the Icom R2 looks pretty neat to me too. It has the full 800 Mhz coverage as well as much better frequency coverage (not just certain bands). However, it doesn't do trunking. Thanks for your help.

If this is the case then what about public service people and why
should they be exempt. Don't they use mikes and radios for extended
periods while enroute and for chit chat. What about parades etc. These
and other questions must be answered to avoid being discriminated
against. Nick

I had the scanner in my lap and was listening via an earpiece.

for a while, I stayed parked on one frequency, and for a while, I just let the scanner search... I was able to hear both sides, the aircraft and the controller quite well... of course, at 37,000 ft altitude you are e line of sight to almost anything.

The metal aircraft skin does degrade the signal or otherwise make monitoring difficult... being next to the window does help

the pilot said it was ok!

Pay close attention to 41232 (which is Roswell PD F-6--Traffic
Enforcement)if you are going to drive through city limits, the traffic
enforcement nazis are always working off there, they'll usually give
their location during traffic stops on that talkgroup, that should
give you a sufficient heads-up! Alpharetta PD doesn't really have a
traffic detail channel but they will use 43280 (PD TAC) for speed trap
operations, most of the traffic stops are done on F1 (43248):

Of course it is possible. Just take another phone of the same model
and do a little reverse engineering.

Fortunately, because cordless phones (unlike cellular) do not need to
interoperate with other manufacturers' phones, each manufacturer is
free to do things in a slightly different and incompatible way, so
even if someone does hack a cordless phone into a general receiver,
the chances of someone doing it with the same model of telephone that
you have are pretty slim.

I'd say you're pretty safe from being monitored for the time being.

You'll need a trunk scanner to hear them, instead of frequencies
you'll need to monitor a "talkgroup" if you want to follow them. They
are on the City of Atlanta trunk, and operate off the old APD A-Info
channel, 35440. See my site below for everything you'll need to hear
them and more.

I have used a RS magnet mount as described, I have also used a RS 20-176 mounted onto a 6' lamp stand on the patio. (my favorite, when your girlfriend lives 400 miles away you learn how to rig.) Reception should be good on the side away from the building, and at 400 Mhz & above signals will go through buildings pretty well in a suburban area.

You will have a problem with TV antennas as they are horizontally polarized, not vertically as are radio waves, and the antenna & coax are not matched for resistance.

Scooter

Generally yes as long as the ad is brief, non-commercial and text
based.

You could also try your luck here:

http://www.whitecliffsdx.freeserve.co.uk/ar_bs.htm

It's completely FREE to use, can include photos of your kit, get's a
lot of hits and the ad can stay on as long as you like.

No catches, I'm trying to give a little back :-)

Cheers,

Jon.

Sounds like the radio is off frequency. There is no deviation adjustment and the ceramic filters are wide enough that there should be no distortion. It takes an extremely accurate frequency counter to properly adjust the master oscillator. Trying to adjust it without the right equipment will probably make things worse. If you set the radio the search 800 MHz freqs in 5KHz steps, that may give you a clue as to whether the oscillator is off. If the search stops on the wrong frequency, the oscillator has prabaly drifted off. The zeromatic circuit in the radio should prevent the search from stopping off channel in a properly aligned radio.

>Thanks folks.
You do not say where you listening from.
It is not at all uncommon to only be able to here one side of 2way
conversations. The CG have very good, directional antennas that allow
them to "listen" in one direction. Very few SWLers can come close to
matching that, and some CG sites have remote receivers tied back to the
comsta over land line(telco). Add to that the uncertainties of "skip"
and it is easy to see why we can sometimes only hear one side.
And I almost forgot, the CG is running a lot more power than a
ship/aircraft/life boat. Into a very good antenna. Another reason why
you often only hear one side.
Good listening!

You might want to back up your EEPROM before doing anything with
the PCR1000. And that includes just unsing it with Icoms' software.
A friend had his EEPROM become corrupted withen a week of getting it.
There are several good EEPROM backp programs out there.
Even if your unit is a late model, high serial number, it is still
fairly easy to undo Icoms fix. Just remove the 0ohm SMC "shunts".
Chose a well lighted, uncluttered area, with no distractions and good
set of magnifing glasses and a good, hot, clean well tinnned soldering
iron with a very very fine tip. Took about 40 minutes and most of that

was being sure I was getting ready to remove the right things.
Good luck

How is that going to work when most of these phones set up security codes
between the base and handset via physical connection (when the bandset is in
the cradle).

Get a clue, moron. My shooting with a million dollar camera is NOT probable
cause to ask me to prove it's mine.

Wouldn't stand a chance in a court of law in THIS country.

Lemme guess - you spend so much time shooting the shit with the cops that you
feel qualified to pretend to be one now? Pffffft.

You're getting pretty pathetic here. I've never been bothered at a crime scene where the media is. I've taken my own photos and only once had some asswipe tell me to get out of HIS way!

I laughed in his face and stood in front of his camera.

>You see the cops in Northern CA. just tell you to "get lost" and if you fail to head
>the order...they use the very broad "interfering" statue on you.

As long as I'm not IN the crime scene and on public property, this would be laughed out of court.

>Keep an good media lawyer in your back pocket.

I think you need to get a new one. One that knows the laws.

That's exactly what Mark told me in my previous post. Pretty funny, huh?

>Does that seem a bit presumptuous to anyone else? Ok, sure.. probable
>cause - maybe I did steal it.

That is NOT probable cause. Period.

>But it's also possible and much more probable
>that I just happened to have that kind of money and free time to pursue such
>an expensive venture, and chose to spend it on a betacam. So how do you
>know? Hmmm?

Right - that's why the fact that you have a camera is not probable cause for some cop to start crawling all over you for it. Simple 4th amendment rights violation. Mark - you might want to have your "lawyer" read that one to you.

>Sitting there pointing at a fellow stringer and saying "I don't recognize
>him. That's probably a stolen camera, etc."

Using those words against me would guarantee a defamation of character lawsuit.

>Maybe I interpreted the message wrong, but considering the responses I've

4505. Help! Lakeland, FL, Trunking

Newsgroup: rec.radio.scanner
Date: 1999-09-17 00:00:00 UTC
From: Greg Fight <fight@gate.net>
Message-ID: <37E252D0.E2FB5E26@gate.net>
Source record: 106827

I've been monitoring the city trunked radio system in Lakeland, FL, for a couple years with no problem on my Unident 235XLT. Now, apparently, the city has re-programmed or changed their software and my scan lists don't work anymore. I can still get everything in search mode - they haven't gone digital or added new freq's, but I can't figure out how to program a fleet map that makes sense.

Please help!

Greg

4506. Yaesu VR-500 receiver ?

Newsgroup: rec.radio.scanner
Date: 1999-09-17 00:00:00 UTC
From: smokedtofu@aol.com
Message-ID: <19990917093907.02237.00000984@ng-fj1.aol.com>
Source record: 106828

Could anybody tell me when the Yaesu VR-500 receiver will be available in the US and what price point it will be at ? It looks like a well thought out mini receiver with direct entry of freqs and other goodies ..

Thanks

Tom Montgomery

Lentini Communications is suppose to receive a shipment today! Price is $329.00.

Also HRO is suppose to receive them today. Enjoy!

Bill

I'm not going to come down to your level with insults. You don't need probable cause to be detained, F.I'.ed or simply questioned. Gosh...the supreme court just ruled that police don't need probable cause to search cars anymore.

Of course you can always invoke your the fifth.

>

For live driver/pit crew audio over the internet during the Winston Cup races (this weekend at New Hampshire is free) check out: http://www.racedayaudio.com

You can pick the drivers you want to hear and hear the entire conversation, instead of a bits and pieces of a bunch of drivers mixed in on one audio stream. They'll be adding a bunch of new drivers next two weeks.

You seem to have mastered quoting. Now you should move on to adding
text of your own, but only after you have fixed your newsreader.

These so-called "security" codes only prevent someone else's handset
from using your base to initiate or receive phone calls - it does not
encode the voice traffic. Monitoring would therefore be unaffected by
these codes.

You don't need a fleet map any more. Lakeland upgraded their system to a Moto Type II. All you need to do is record the talkgroup IDs you're seeing in search mode and reprogram your scan lists using the new IDs.

If you have a shortwave radio whick covers 10 MHZ, you can zero beat
the TCXO in the 2006 with the WWV 10 MHZ signal.

I do that to check the accuracy of my 2006's. Had one new, out of the
box that was a bit off center.

I could post the 'how to' if there is any interest. Mebbe an
additional web page since I now have more space.

Good Signals... LCM

I am moving to NYC and I want to purchase a new
scanner for my apartment I need some suggestions
I am coming from a fairly rural area to a big city
and want to be able to have good quality reception
I am still not sure if I need a trunk tracking scanner
in NYC as I really havent spent alot of time investigation
the freq their.
Any suggestions greatly appreciated And where should I buy
in NYC
Thanks

>A lawyer with a scanner that makes all scanner owners look bad.

I'm sure some do monitor the scanners but most law firms have runners (fancy word for errand boy/girl) and they just have them pick up copies of the day's accident reports at the local court house at the end of the day. Yep, they are ambulance chasers.

I have a tremendous respect for the work the police do there job is never done and always demanding. But as a society we should never take on the notion we have nothing to fear from police. They are picked from society and given a WHOLE lot of power over you and me. Not all are good just as not all of your neighbors are good. If you are a law abiding citizen good, but if an officer doesn't like your skin color, disability, car you are driving, gender, etc... then they can make things miserable for you. Scanners are good. They allow citizens to hear what the empowered law directors are doing. Video and technology has made many a police force change how it operates. The old "code of silence" is going away and not a moment too soon. My 2 cents. Keith

>> They are trying to hide their investigations from those who are being
>> investigated: the criminals who listen to scanners set to police
>> frequencies, to know when officers are assigned other calls, so they
>> can rob their banks and liquor stores. Normal, law-abiding citizens
>> have nothing to fear from the police.
>>
>>

: close range mode and AM is more for med-long range.

This is not true. The distance at which a signal can be heard is a
function of power, antenna gains, antenna heights and frequency.

The reason for using AM for aircraft is so that others will know if more
than one aircraft is transmitting at the same time. With FM, all you would
hear is the stronger signal. That is a great safety risk.

Yes, I am a licensed pilot.

>>scanner. Any opinion on these phones is welcomed.
>>

The real point is to make sure you're on a phone that will be
difficult to scan, not impossible. You'll never have a wireless phone
that *somebody* with enough expertise and time couldn't listen in on.
You really only want to make it hard enough to not be worthwhile. For
that, a digital 900mhz phone is probably sufficient. Or a digital
spread spectrum, if you really want to get elusive. Those are two
hurdles that would require a LOT of work to overcome, and chances are
good that before anyone mass-produces a product that will overcome
those obstacles you will be long overdue for a new phone anyway.

Additionally, keep in mind that many handheld scanners won't even step
in the proper multiple to scan 900mhz phones. My Pro-90 for example
flat out misses most of the frequencies that most 900mhz phones use
because of differences in steps.

Nice base scanners are a different story, of course, but still aren't
going to be overcomming spread spectrum and digital transmission both
in the same piece of equipment anytime soon.

Another thing to consider...are you using the correct steps for the band
in use?
One of my 2006's had off-frequency channels on UHF, due to the previous
owner searching using the wrong step.
ZeroMatic is great, but it will not work properly in this situation.

That's an easy one.
When you go to buy your new phone, look for those
that have either "digital security" or "spread spectrum" printed
on the outside of the box.
Good luck

Ditto on the Peltor products. I have Frequency Fan's
(http://www.racescanners.com/) Solution 2 "behind the head" headset.
It is made by Peltor, and it works great. I don't know of any with a
higher noise reduction rating.

HEY FOLKS!!! This scanner was canceled on EBAY (Communist EBAY) BUT IT'S STILL FOR SALE!!!!

1000 channel CAMNIS hand held scanner. Model HSC-010.

Freq range: 0.5~86Mhz, 110~1300Mhz. The gap you see here is the ONLY gap in this unit!

Fully Cellular capable! Comes with ni-cads. 220 volt plug in wall charger... (unit was purchased in Sydney Aus, thus the 220v charger) NEW IN BOX!!! This unit has been used less than 10 hours! (I have 5 other scanners and another scanner is getting to be overkill)

Unit has narrow band FM, Wide band FM, and AM capabilities. Sorry, No SSB capabilities unless you add a BFO to it.

It also has 10 pre-programmed bank searches.
(in bank 1, it searches from 108.0 to 142.8 Mhz)
(bank 2: 225.0 to 261.0)
(bank 3: 275.0 to 364.0)
(bank 4: 140.0 to 156.0)
(bank 5: 156.0 to 162.5)
(bank 6: 430.0 to 440.0)
(bank 7: 450.0125 to 460.0)
(bank 8: 870.025 to 904.9875)
(bank 9: 8.0 to 800.0)
(bank 0: 805.0 to 1300.0)

Also has the capability to search in any frequency limit you choose.

The scanner also has 10 banks of 100 channels each (1000 channel scanner)

All this info is right out of the manual (included)

Only $200! I paid $265 for this unit and $200 is a great price for a unit with these capabilities!

if interested, email tyler@cyberia.com

I would... before anything else.... find out if they trunk because you will not be a very happy camper trying to follow a trunked system with a non-trunking scanner....
That should then narrow your choices down a great deal...
Have a GREAT one !

Message-ID: <37E3AA13.21766C46@columbus.rr.com>
Source record: 106672
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I've had my bc245xlt about a week and I must say I really like this radio and its functionality. However, I have a few concerns:

1) There is a detectable low-level "hiss", regardless if I'm scanning or in hold/manual mode, and it's not effected by the volume level (can't make the hiss louder or quieter), the squelch level or if it's on battery or AC power adapter. This is only noticeable in a very quiet environment or if I have the unit up to my ear or when using ear/headphones. It's not terribly annoying, but I'm thinking that this is shortening the battery life. My old radio (RS Pro-34) is dead quiet between signal receptions.
Anyone have any idea if my radio is possibly defective, or can explain what this "hiss" is?

2) These ni-cad batteries are a pain. My Pro-34 lasts a month or more on 6 AAs Duracells. The 245xlt needs to be recharged every night. (Of course it's my new toy, so I'm probably using it more.<g>) Are there battery options? Maybe a second set I could have in an external charger while I'm using the first set?

3) I need to get an in-car cig. lighter power cord. Any ideas where to get one? Does Radio Shack have a generic one that is compatible?

4) I would like to explore the pc/remote feature of the bc245xlt. Please post URLs or recommendations for control software. Radio Manager? ScanCat? software reviews? pros and cons?

Thanks in advance for any input.

mb

I would be shocked to find that there aren't any trunked systems in NYC. It's possible that the police force isn't trunking yet, but unlikely that nobody in that city is. That being the case, and because it seems to be one of the waves of the future, why not start out with a trunk tracking scanner now rather than having to replace a non-trunking one in a year or two?

As for which model to purchase, there are a few ways to go. You mention that you will be using it in your apartment. That probably means you're not looking for a handheld. Otherwise I would suggest a Pro-90. But the 'base unit' version of the Pro-90 is the Pro-2050. It might meet your needs.

You might also wait until RS releases its new line of trunk trackers; the Pro-92 and Pro-94. Of course those are the handheld versions. There may be a similarly featured base unit as well.

Christians themselves admit that they are *all* sinners from the day
they are born. Hence by definition there can be no good Christians.

There's anwers to some of your questions at this link:

http://www.strongsignals.net/bc245xlt/bc245faq.htm

The hiss is most likely caused by using a cheap amplifier
in the audio circuit. There are better 'low noise' amps
but they are more expensive. For the most part, most people
have it turned up loud enough that the hiss is never noticed.

Remember, alkalines last much longer than nicads on a single charge. This is normal. Plus, as you said, you're probably using it more.

>3) I need to get an in-car cig. lighter power cord. Any ideas where to
>get one? Does Radio Shack have a generic one that is compatible?

I use their "heavy duty" cord with my various Bearcat handhelds. Cost is $5.99, I think. Been using it for several years now with no problems. They sell a cheaper version for a few bucks less, but the wires are thinner and the construction is sub-par. Spend the extra and get the better cord. You'll be glad you did.

People will believe what they want to believe. If someone wants to spend his/her workday with a cellphone attatched to their ear, they will deny any possibility of later negative consequences due to their actions. "Don't confuse me with the facts" applies here. They just don't want to hear it.

I am clearing out the ham shack of all my QST magazines once again. If anyone is interested, I am selling
1992-1998 at $1.00 ea. (you pay shipping costs however you want them shipped). If you
are interested in over 12 issues or the entire collection, make me an offer. I am willing to ship anywhere on
this planet so long as you are willing to pay the shipping costs.

Here are the issues that I have:

QST

1992 Jan - April $1.00 ea.
1993 Jan - Feb & April - Dec $1.00 ea.
1994 Jan - Oct & Dec $1.00 ea.
1995 Jan - Dec $1.00 ea.
1996 Jan - Dec $1.00 ea.
1997 Jan - Dec $1.00 ea.
1998 Jan - Dec $1.00 ea. (May issue is missing page 73)
1999 Jan - Current $2.50 ea.

All the issues are in perfect condition with no ripped pages or covers. Sorry I don't have anymore, but the last
time I did this in 1993, I sold all my 1989 through my 1992 issues less a few months still available.
If you would like to check my references, please feel free to do so. I am on Ebay and my user ID is: Andrew45
http://cgi2.ebay.com/aw-cgi/eBayISAPI.dll?ViewFeedback&userid=andrew45

Source record: 106702
Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.swap

I have a Uniden 200 XLT, no gaps, for sale, 200 channels.

I am the original owner, have box, charger, manual, and original "leatherette" case and original antenna.

This is in excellent shape, with some very small scratches on the display.

I am asking $195 USD, FIRM. I have done nothing to the scanner (except THE mod), like the battery mod, or anything else. It has a bright backlit display, and is not computer programmable, but is extremely easy to program.

Please send all inquiries to my email acct: dabiggs@earthlink.net. I am not interested in going to Ebay, or anything like that. I just want to sell it to the ONE who is interested. Please leave a phone number in the email, so that I may contact you.

I will pay for shipping, in the US and the insurance. Terms: COD, (Money Order, no checks please).

Thanks,
Len Gibbs

Hard to pass up a response to an ignorant, inbred asshole such as this one. Having lost my son ten months ago (that means he died Barry), I know how how I would take it if some lowlife such as yourself took a cheap shot at myself or someone asking for a prayer or an any expression within their spiritual belief for the welfare of me or my deceased child.
This has nothing to do with religion pal - I hope you get a chance to experience what Christians refer to as hell. If I can somehow contribute to that - all the better.

I have yet to find one !!! With all the tech out there, you would think someone could come up with something worth $40 that receives as good as a base loaded mobile ant. low profile. I use the radio shack multi-band dual load whip. Great receive, but its just as bad as drilling, if not worse. So in answer to your question....NO !!
Good luck

Kevin

Well, I begrudgingly went with the permanent NMO mount. Did one for
the scanner and one for the 2-way. Actually came out really nice.
Looks a helluva lot better than the old mag-mounts I used to use.
Hopefully the performance will be better. We shall see. Thanks
Kevin.

Great thought. Deep space forever unknown within your brain.

the idea of christ is a story made to
get people to give up on themselves
as the universe. Xtians exist because
they need to be led. Seeing as how
the whole xtian theme is a written
chronology of a science fictionalized
drama written a few years ago: 1100 or
so., we find the idea of god a bit
suspect. Man invents god to be
able to be in control whereas normal
man would just ignore and walk away.
give it a "GOD" and you make people
feared not to do what you want and
therefore the whole bullshit story is
told over and over again...but one
thing is missing: HE never shows up.

now take this post over to
alt.religion
alt.piety
alt.christianity is looney-time
etc.

xtians are by their very name cowards. Too scared to
look and see. Minus the rope around their mind put
there by no one we can see.

bill conduit
etc.

I have a KX-TG 200B 2.4Gig and I can pick up handset to base
transmissions in the 900MHz range so if security is a concern I would
look elsewhere. Otherwise the phone performs OK, although Ive never been
really impressed with it.

I have a partly working Everex 386SL/25 with 60MB HD(unknown condition),
Bad battery and GOOD power supply. The unit starts up and seeks HD &
Floppy. I have no software for this unit. Screen is in good shape, but
hinges are bad. Laptop has seem some use, selling as AS iS. Comes with
nylon carrycase, power supply ans computer. Sell $50
Or consider trades

4598. Pre-Ban scanners

Newsgroup: rec.radio.scanner
Date: 1999-09-19 00:00:00 UTC
From: scanshack@aol.communicate
Message-ID: <19990919112234.13024.00002118@ng-fs1.aol.com>
Source record: 106598

Here is a list of the pre-ban scanners of which I am

aware that should be capable of frequency restoration:

PRO-2004 BC-855XLT *3 Regency 4030

PRO-2005 BC-200XLT Regency 1600

PRO-2006 BC-205XLT Icom IC-R10 *7

PRO-2022 BC-760XLT *4

PRO-2026 *8 BC-700A *3

PRO-2027 BC-890XLT *4

PRO-2030 BC-950XLT

PRO-2032 BC-2500XLT *3

PRO-34

PRO-37

PRO-39

PRO-43 *1

PRO-46 *2 *5

PRO-51 *6

PRO-23 *6

Note 1: Date code of 2A4 (Feb94) and prior, any xA3, any xA2 (label in battery compartment), or no "A" in the serial no. (Date code 3A4 (Mar94) and after WILL NOT WORK !)

Note 2: Date code of 2A4 (Feb94) and prior, any xA3, any xA2 (label on back).

Note 3: Date of mfg code must not end in the letters "ID" or after. (ID=94), except for OAID (Jan94). (On BC700A some "OBID" (Feb94) work)

Note 4: Date of mfg code must not end in the letters "ID" or after. (ID=94)

Note 5: Units with date code of 5A4 (May94) can tune the restored frequencies in 30 kHz Steps using a keyboard entry sequence after a wire on the "newly attached" daughter board is snipped.

Note 6: Units with date code of 6A4 (Jun94) and prior (and some 7A4) can tune the restored frequencies in 30 kHz Steps using a keyboard entry sequence. After

date code 7A4 (Jul94) no mod can be done.

Note 7: The current 1998 models are. New reports say Icom is now only importing non-modifiable versions.

Note 8: Model (catalog) number with "B" at the end not modifiable. (Reported no L201 jumper on the circuit board)

The below list are those scanners that were capable of receiving the full 800 MHz band,

without modification:

J.I.L. SX-400 AOR-950 Icom R-7100 *

Regency MX-4000 AOR-1000 Icom R-1*

Regency MX-5000 AOR-1500 Icom R-100

Kenwood RZ-1 AOR-2500 Icom R-9000

Uniden BC-800XLT AOR-3000 * Icom R-7000

Yaesu FRG-9600 AOR-8000 *

* pre-1994

Decoding Those Radio Shack Date Codes

Decoding the date code on your Radio Shack scanner is as follows.

The date code consists of a number (from 1 to 12), followed by the letter "A", followed by another number (from 0-9).

The first number represents the month of manufacture, while the last number represents the year. (The "A" acts as a separator.)
For example, the date code

3A4 would decode to March 1974 or March 1984 or March 1994

Note that the decade can't be precisely determined but a quick check in a Radio Shack Catalog will help you to determine a decade.

Decoding Those Uniden Date Codes

Decoding the date code on your Uniden Bearcat scanner is as follows.

The date code consists of a two digit code representing the month followed by another two digit code representing the year.
For example, the date code

0AID would decode to Jan 1994 0A = Jan (A=1, first month of year) ID =94 (I=9, D=4)

0EIC would decode to May 1993 0E = May (E=5, fifth month of year) IC = 93 (I=9, C=3)

A=1, B=2, C=3, D=4, E=5, F=6, ETC......

What's THAT got to do with cellular phone calls? These
weren't leaked third-party during cell phone calls.

Todd

Wrong. Todd (that's me) was quoting statutes exempting the
Press from carrying scanners while _mobile_. The allowance to
carry a scanner portable or mobile has nothing to do with
whether the media is allowed to monitor and divulge cellular
phone calls. They are not. They are bound by the ECPA, and
other privacy laws, NOT to divulge. They are NOT exempted from
listening to cellular phone calls.
Your argument whether it comes from third-party is also false.
The Senator who received the tapes from the Fort White couple in
Columbia County, Fla. and then divulged those copies to the
media got in big trouble.
After this, the laws changed bigtime. You have that Fort
White couple to BLAME for not being able to listen to the
cellular and portable phone conversations, in fact. It was
thier stupidity that started the ball rolling.

> please quote the statues

Again...ECPA. Go to Yahoo or similar and look up "Electronic
Communications Privacy Act." Also, see Dave Stark's site:
www.nf2g.com, for further federal laws prohibiting monitoring
and divulging.

Course, having been now warned, if you still decide to
monitor, record, and divulge on a news agency, I will be witness

that you were warned by SOMEBODY, and you will loose your license, suffer jail time, a large fine, and your broadcasting company, or newspaper - whereever you work, will lose its license.

Name one news agency since the Fort White incident that monitored a cell phone call, recorded it, and reboradcast it on thier nightly news, and didn't get in big federal trouble.

Incorrect. The ECPA law against monitoring cellular phone calls (later amended to include cordless calls as well) was passed long before this incident took place. Ditto for the 1994 rules banning the sale and importation of cellular-capable scanners.

Note: this address does not accept unsolicited e-mail. Please contain all discussion regarding USENET posts to the appropriate newsgroup thread.

Thats right. Thanks.

Yes, the law that included port. phones came about a year or
so before I overheard my next door neighbor bragging that he'd
shot my cat with his pellet gun. How's THAT for a bummer?
(You overhear it and to report it YOU become a criminal
violating federal laws, risking fine, imprisonment, or both.
Needless to say, I kept it quiet and so that kid went on to West
Point. Ironic, eh?

All:
I have the following notebook PC's that are now surplus to my requirements. I would like to swap for specific scanners in good working order. Please note, I prefer to trade and deal locally and not through cross shipping. I am located near Sacramento, Northern California.

1) Toshiba 410CDT: Pentium 120Mhz, Active color screen, 40MB RAM, Built in CDROM. Has external floppy, power supply etc.

2) IBM 365XD:Same spec as above.

I am looking for the following trades:

1) AOR3000A in excellent shape. Would trade both notebook computers.
2) RadioShack Pro2006 with OS456 board. Negotiable, both computers possible if extras of cash offered.
3) Opticom radio scanner from Optoelectronics. Will trade both computers.

Again, please only CA residents at this time. If I have no success I will repost to the group.

brumey@ns.net

frequencies for my area? I live in Southern Illinois, Murphysboro to be exact, and would like to know of a free way (hopefully) to find the frequencies used by my town. Is it as easy as calling the police/fire station? You can tell how new I am to this hobby. I don't know if the information is public domain or if the PD/FD will give up the information easily. I don't really want to have to buy a book, as I don't really want all the other stuff. Perhaps if anyone has access to the information, they could post it here for me?? I'm interested in all frequencies having to do with Murphysboro, IL. Hope some kind soul out there can point me to a web site or give me the info. Thanks so much in advance,

Judy

Having lived in NYC for a number of years, I would suggest a handheld unit.

There is nothing like being on the subway and knowing that the reason you
are stopped is because someone is under the train.

It actually helped me a lot in being able to get around by different routes
due to issues like this.

As for the trunking, I know of only a few agencies which are trunking, But
I agree on the otheres here as to buy a trunking now.

Best of Luck.

PS. I moved out a year ago and miss the excitement I got from it but don't
miss living in the second highest murder pct.

Cross-posted to: alt.radio.scanner,rec.radio.scanner,alt.radio.scanner.uk

which scanner has the best-sounding audio on WFM??

when i say "best" i mean that it has nice clarity, does not sound compressed/narrow, etc...

i've narrowed it down to these few but may have overlooked some other scanners worth mentioning....

Yupiteru MVT-7100
Yupiteru MVT-7200
Sony SC1
Sony SC1PC
Icom IC-R10
AOR 8200

anyway, i'm looking for a definitive answer on which unit sounds the best. i'm strongly leaning towards the Sony SC1 or the MVT-7100. i'm not sure if there's any improved difference in the audio on the 7200.

thanks for the help...

There are probably a lot of websites that will have that info. I used
Yahoo to search for "radio scanner" and then sifted through the tidle
wave of info until I found some good sites for my area.

Also, drop in to your local Radio Shack (*gasp!*) and buy "Police
Call". It's a frequency guide that will surely have information for
your area. It costs around $10.00 I think.

4629. Re: Where to buy a MOBILE MOUNT in NJ?

These mounts are made by several vendors. Hutton (http://www.huttoncom.com) and Tessco (http://www.tessco.com) are large land mobile radio equipment distributors and will have something that will work for you. You will probably need the help of the mfgrs people to help you determine what parts you will need to buy.

Another recommended alternative is to go a local full service 2-way shop and have them help you out. They often stock many of the parts that you need and have experience configuring these mounts or fabricating them from scratch. Be sure to go to one who does installations for for several local police/fire departments and has experience with custom installs. I had a really nice mount fabricated from scratch for my recent installation.

This isn't going to be inexpensive, no matter which approach you choose. You should end up with a first-class installation, however.

Good luck,

John

Barry,

I happen to be a Christian that is into scanning.
I like listening to the local public service frequencies and the website Rich
Wells runs, and the message
board for the BC245XLT is both an informative site and one of the most active
sites on the net
devoted to the scanning hobby. Rich Wells doesn't have to put the time into
his website that he does
but he provides quality information and he provides it for free. One scannist
above said, and I quote:
"I hope you experience what Christians refer to as hell." I on the other
hand, hope you and the
person wishing you hell both take the time to read the Bible, and follow the
example Rich Wells
has set for the scanning hobby: being civil, being respectful, and treating

each other like human
beings. No one asked YOU specifically to pray Barry, then again, perhaps an act of kindness is
too much to ask for in this day and age, and the worst part is, all it would have cost was a moment
of your time. A line from Matthew 26:52 says: "for all who draw the sword, shall die by the sword."
Perhaps, someone will show you the same amount of compassion you've shown you have in this
newsgroup.

Yes, I'm a sinner and have been since day one. But Jesus paid for my
sins.
I'm not a fire and brimstone bible thumper as the secular world might
say, but
it is my belief that I am a good man, and will tell anyone that wishes
to listen
and learn about the Lord, exactly what I know. Those that don't want to
listen
or wish to engage in a flame war, don't even bother. A wise chinese
person once
said, to argue with a closed mind is a complete waste of time.
Now, enough of this non-topic posting in the scanner newsgroups.....

>media outlet.

Whether in your personal opinion they "should" or "should not"
doesn't matter. What the law states _does_.
And the laws usually go farther to define allowable media as
"press on official assignment" - that means on the clock, with
an ID. If you're not on official assignment, you have as much
right to search out an accident and be there as a lawyer trying
to swipe up customers for a lawsuit, or the average citizen with
no reason to be there in the way, or the off-duty cop or
fire/rescue personnel.

To look at it from another point of view, you and I both have
a right to have the best possible police, fire and rescue
efforts made when something serious happens to us. If these
stray idiots (lawyer ambulance chasers, gawkers, etc.) who don't
need to be there get in the way and cause precious time to be
wasted because they're too busy trying to corral them, or to
think/worry about them and thier own safety instead, or a wrong
assessment is made of our situation as a result, or an incorrect
on-scene diagnosis made of our injuries (its called diverted
attention/concentration), then you or I are put at grave risk,
unnecessarily.

THAT'S why these laws are there.

Careful of your boss. He sounds deliberately vague with his instructions in the hopes you'll get something, and like he worries about the legalities later. He could get you into trouble and leave you holding the bag one day. That's a rule in Basic Business 101. That's how things go these days. Lie. Cheat. Point the finger at the other guy. Deny any fault on your part. And when everyone else isn't looking, stick your tongue out at the guy just screwed by you, and flip him the bird for good measure.

If you just need the flat cable that goes into the radio's socket, you might consider making one from a salvage laptop floppy interface cable. I found them surplus ant for 39 cents each and a good pair of scissors, was able to make three 12" cables from each.

The murder of Steve Kangas was the precursor to the murder of
JFK Jr. It's a shame that an obvious murder like that of Steve
Kangas is called a "suicide", evidently one of the stupidest

verdicts of the 20th century. It's easier to believe that OJ was innocent, than to fall for the fraudulent claim that Kangas was deramged, Kangas penetrated Scaife security and spent hours unnoticed, drinking in a washroom outside of Scaife's office, before he shot himself in the head. Anybody who believes that requires an instant dose of shock therapy.

Thanks for your good points in the recent threads, Todd. I'm still waiting for one of these guys who claim they have an 'exemption' from the ECPA to post proof of the exemption. I'm not holding my breath.

I'm not claiming the exemption is not out there somewhere cloaked in legalese too dense for me, but, as you pointed out with the cell phone exemption claim, if they had a 'blanket' exemption from the ECPA that would mean they are exempt from the cell phone portion also and we know that's unlikely since all those congressional hypocrites conducting their affairs (!) over cell phones would squeal like stuck pigs and switch to PCS. <g>

And as we know that the folks that issue the credentials are the ones most vested with self-interest in seeing that the media portrays them in the best possible light, we can throw any intimation of altruism right out the door. Either those credentials give you, in effect, 'most favored nation status' and let you into places 'civilians' aren't allowed, or they aren't worth the recycled paper they're printed on. And the ratio of favorable to unfavorable stories regarding the credential issuers better be in the issuers favor or the credential petitioners might find themselves a few slots short come expiration.

I would like to think that this sham, symbiotic (note, I'm still using the nice word for this) relationship would be shown for what it is if about 1000 of us declared ourselves Internet Reporters who work for www.news.org and applied for press credentials at the city hall. Isn't it a shame to have to have lawyers exist in the first place, and then not be able to afford them anyway? <g>

|
| Whether in your personal opinion they "should" or "should not"
|doesn't matter. What the law states _does_.
| And the laws usually go farther to define allowable media as
|"press on official assignment" - that means on the clock, with
|an ID. If you're not on official assignment, you have as much
|right to search out an accident and be there as a lawyer trying
|to swipe up customers for a lawsuit, or the average citizen with
|no reason to be there in the way, or the off-duty cop or
|fire/rescue personnel.
|
| To look at it from another point of view, you and I both have
|a right to have the best possible police, fire and rescue
|efforts made when something serious happens to us. If these
|stray idiots (lawyer ambulance chasers, gawkers, etc.) who don't
|need to be there get in the way and cause precious time to be
|wasted because they're too busy trying to corral them, or to
|think/worry about them and thier own safety instead, or a wrong
|assessment is made of our situation as a result, or an incorrect
|on-scene diagnosis made of our injuries (its called diverted
|attention/concentration), then you or I are put at grave risk,
|unnecessarily.
|
| THAT'S why these laws are there.
|
|Todd

4646. pro 25 light mod?

Newsgroup: rec.radio.scanner
Date: 1999-09-19 00:00:00 UTC
From: tomcat4680@aol.com

THE MAN (none@Y2K.com) hath said:
>: What is RESCUE 1504 heard on 8982.8 U.S.B. being called
>: from Cheasepeake?

This is a United States Coast Guard HC-130H aircraft homeplated at Coast Guard Air Station Elizabeth City, North Carolina. The correct frequency is 8983.0 KHz which is the primary nighttime USCG safety-of-flight frequency. Chesapeake is Communications Area Master Station Atlantic (CAMSLANT) located at Portsmouth, Virginia.

For a complete listing of USCG aircraft and homeplates and further information on USCG HF frequencies, check out the Worldwide Utility News webpage at http://www.wunclub.com

USCG aircraft use the callsign RESCUE when they are on an SAR flight, otherwise they will identify simply as "Coast Guard 1504" or whatever the aircraft is.

What to listen for
Here is some information that might be useful while listening to
Bethlehem's trunked radio system.

EMS units are dispatched on either an alpha, bravo, charlie, or delta
response to a call. A delta response is the most rapid response, an alpha
response is the most cautious.

Moravian College campus security, Lehigh University campus security,
and Bethlehem Area School District security all use Bethlehem's trunked
radio system.

Here is a list of unit numbers you will hear, and what department uses
them:
100's and 200's - Police Department (Unit 200 is the Comm. Center)
100's, 200's, 300's - Fire Department
400's - Parking Authority
500's - Moravian College Campus Security
700's - Paramedics
800's - Lehigh University Campus Security
900's - Bethlehem Area School District Security

Bethlehem's Radio Codes
Here is a list of radio codes used in Bethlehem.
Last Updated: 7/19/98

Check out Prime Cell for an excellent NiMH replacement battery. I
don't have their web address, but I bought mine on ebay! Search for
BC245XLT on ebay's site. Paid $18.95 + shipping -- still less than the
retail replacement price for the nicad! Only drawback is that you
have to charge it for 24 hours if using your regular charger.

The power pin is smaller than the stock RS power cord, but RS does
have a heavy-duty multi-tip adapter that works just fine. It's
$16.95, and I don't have the stock number.

HI.. I need a little help here, I have a Icom R1 Scanner and I need a better manual then what came with the radio. The manual is really not that clear on how to do things when it comes to programing it or setting different banks. Is there anyone who makes or has written a different manual for this radio.?
Thanks

4658. PRO 91 Discriminator Tap Instructions

Newsgroup: rec.radio.scanner
Date: 1999-09-20 00:00:00 UTC
From: Phil Smalley <ziggy7445@scanner.yahoo.com>
Message-ID: <7s6cf1$2oe$1@phxtst22.phx1.aro.allied.com>
Source record: 106494

This may be old news to some, but upon asking around, I got no answers so I figured once I got around to doing it I'd share my results with the group.

BUT FIRST A WORD OF CAUTION: It never fails that someone will stumble across even the simplest of modifications and somehow manage to toast their scanner. I am hereby stating that if you read this post and decide to tinker with that unit this will be YOUR problem, not mine. If you break it, too bad. Not my fault, I didn't hold a soldering gun to your head, now did I? I am NOT responsible if you kill your scanner, OK? OK, on with it then...

NITTY GRITTY DETAILS: For those of you who know what your are doing and just want to know which pin and chip, it's MC3361CN, Pin #9. Have fun. For those who need more detailed instructions, read on below...

DISASSEMBLY of the PRO 91: Uniden does not want you to do this.(Yes this is a UNIDEN scanner.) This is evident in just how difficult the scanner is to take apart. You will need a small philip's head screwdriver AND a butter knife or similar implement to pull it off.

I don't think I have to tell you to unplug it first...but I will anyhow. Unplug it from the wall. Remove the battery cover and the batteries. It's also helpful to remove the antenna, just because it can get in the way during disassembly. Then remove the 4 screws that hold it together. You don't need to remove the belt clip, but I did just to keep it out of my way.

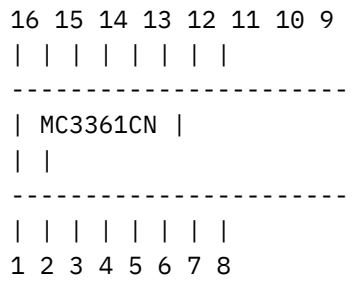
Now, using the butter knife, carefully run it along the edges of the scanner so that you can see a slight gap in the seam. Then use it to CAREFULLY pop the battery compartment area free of it's retaining flanges at the bottom. You'll see what I mean...

After about 5 minutes of fiddling with the knife, you'll get it free. Notice the large metal cover over the back half. Like I said, Uniden didn't want anyone tampering around in here. It's tempting to remove it, but don't bother trying - I did and found out that you can't - it's EPOXIED on! Fortunately, we don't have to mess with it.

Unplug the back board from the front one - it'll happen automatically when you pull it apart - just be mindful of the plug and don't bend those pins. The plug is located on the side opposite the power jack. Turn the board over and you will see the chip we'll be working on - MC3361CN. It's towards the bottom, right near where the speaker wires plug in. Can't miss it. I didn't bother to unplug the speaker, but you can if you want.

SOLDERING THE TAP IN PLACE:
The pin we want to tap is pin 9, per Bill Cheek's scandata.faq file. I confirmed it for myself last night - it works. Thanks Bill! For those who have no idea which pin is pin 9, see the diagram below:(use a fixed width

font to view)



Pin 9 will be in the upper right hand corner. I simply took apart an old mono earphone I had and connected the + lead of it to this point. The decode rate I am getting is OK, but nothing to write home about. I'm going to put a 1.0 uf capacitor inline to see if that improves things, and I am suggesting here that you do the same. So, on pin 9, solder the + leg of a 1.0 tantalum capacitor to it, and then solder the tap wire to the other leg. Then pick a ground point (the metal plate that the antenna jack runs thru is a good spot) and connect the other lead to it.

I then just ran the wires down and out where the batteries go, and let the plug dangle out thru the battery compartment. You will find it closes just fine with this cable in the way. However, those going for a more "pro" look will probably want to get a 1/8 mini plug jack and mount that in the case somewhere. Have fun - I'm too lazy for that. ;-) Plus, if the scanner ever quits for any reason, it's a simple matter to remove the tap wire prior to shipping it off for service. Sure it's ugly, but it works right?

REASSEMBLY: Other than being careful not to bend the pins on the main board as you plug it into the socket on the other board, reassembly is fairly simple. Press the two halves together gently until you hear it "snap" into place. Then put the screws, antenna, belt clip and batteries back in and plug it into your favorite decoder or PC sound card - whichever method you use for data scanning. You're done!

LEGAL NONSENSE: Some people would get upset if their modification text appeared on someone's web page, in a book, on TV, etc. I'm not one of those people. I could care less who you give/sell/trade this info to or for what. More power to you. Don't get mad though if I spoil your party by telling everyone where they can get this info and more for free: Dejanews.com. If you would like to include it on a web page (I can't imagine why, but hey it's YOUR page...) you have my permission if you'd just be so kind as to mention who wrote it. If you don't, you can still have it, I won't come after you or anything, but it would just be a nice gesture. Thanks.

Hope that was helpful - I'm sure someone out there has a pro 91 and wants to do some data decoding with it! It works pretty good for that. Much easier than carrying a bulky 895 around!

Have fun...

I've scoured the web in search of some that use Windows Media player. I
can't get realplayer to work over our firewall - it won't log into it. But
Media player is compatible with it. So how about it? Anyone put up a Media
player scanner page?

4660. QSL Maker

Newsgroup: rec.radio.scanner
Date: 1999-09-20 00:00:00 UTC
From: nw7us@hfradio.removethispart.org
Message-ID: <PyyF3.112$1C.3282@sea-read.news.verio.net>
Source record: 106496
Cross-posted to: rec.radio.scanner,rec.radio.shortwave,rec.radio.swap

Hello,

WB8RCR has recently posted a new version of his program, 'QSL Maker' - check it out at http://hfradio.org/wb8rcr/

This is a Windows 95 program, It will not work under Win 3.1. The program has also been used on Windows 98 and Windows NT Workstation 4.0.

- When you first bring up the program, you are shown a dummy QSL design.

- Simply enter your call and address and you have a useable, if somewhat dull, QSL.

- Your call, name and address are remembered for future launches.

- You can adjust the position, color, and font for all the elements of the card.

- You can use a Windows bitmap as a background for your card.

- Once you have the design you like, you can save it for future use. In fact, you can save any number of designs for special purposes, events, etc.

- There are 2, free-form lines for your QRP-L #, FISTS #, 10-10 #, grid square, awards, etc.

- The info block can be removed for those who would like to write this information on the back.

- Dockable toolbars, put them where you want.

- There is a full-blown installation program, and complete deinstall.

- There is extensive help.

- If you use custom colors, they are remembered across launches.

Again, this is software by WB8RCR. Come check it out.

There is more danger from the tower falling down than radiation!
Energy is not directed downward.
And when was the last time you saw a tower fall down?
Maximum efficiency occurs with a doughnut shaped pattern.
I know a person who lived very close to a UHF TV station in Montclair,
NJ, and he could not get decent reception from that station.
It drove him crazy, because the station transmitted *scrambled movies,
and he even built a home-brew descrambler.

Al

* the old suppressed horiz sync pulse system, which could be picked up on
the audio carrier using an FM PLL chip.

Or you might find a GMRS radio that is conveniently programmed for FRS.
This of course is illegal if the radio puts out more than 1/2 watt(which it
does) and modulates at more than 2.5Khz.

I'd be interested in seeing this $200 mobile. Please give us a direct URL
instead of making us click all over the place.

is
> there 5x5 but poor audio. any help?

Shooting in the dark, but here goes:

Hum may be due to poor filters on audio amp, check C84, 47 uF at 25VDC
supply filter cap.
Hiss may be due to improper lo offset - check transistor logic on NPN Q12
(collector low for UHF operation)
perhaps the I.F. is out of adjustment - any other info? How is it doing on
VHF? LO band?

Trying to help,

> Pete
>
> For e-mail replies, remove hyphenated text after @ sign
>
> Edmonton, Alberta Canada

The most common frequency pairs to check are:

30.8400 --- 154.5700
31.0000 --- 170.3050
33.1600 --- 154.5100
33.4000 --- 154.5400
35.0200 --- 154.6000 *
154.5700 --- 170.2450 *
154.6000 --- 171.1050 *
457.5375 --- 468.3875
457.5500 --- 467.7750
457.6000 --- 467.8250
461.0375 --- 466.0375
460.8875 --- 465.8875
461.0875 --- 466.0875
469.0125 --- 464.0125 *

If they're using "3M" or "GM" headsets then you need to search from
920-922 Mhz Wide FM for the speaker frequency and from 903-905 Mhz Wide
FM for the headset frequency.

BTW, all Fast Food chains that use headsets have the capability of
using their internal comms. This is accomplished by using various CTCSS
PL Tones (example: a PL tone of 77 Hz for outside comms and 162.2 Hz for
internal comms).

A current list of Fast Food frequencies can be found at the following
URL http://pages.prodigy.net/hounddog/fastfood.txt

: Response ambulance service in Anderson S.C.
:
: Thanks
: Waldo

Sorry don't have them for S.C. you might want to try the FCC
Public Safety Database and search that way, here in south
Mississippi they use 155.220 and 155.400.

this is the url to the fcc database:
http://gullfoss.fcc.gov:8080/cgi-bin/ws.exe/beta/genmen/index.hts

Sorry for re-posting everyone. I forgot to put my e-mail address and stuff. If you can please remove my other post. Thank you!

Bret@reggaejuice.com if you have anyomore questions thank you!

This BC3000XLT is one month old. I took a picture of everything because I thought that you might like to see what I am selling. Sorry for it being fuzzy it was taken with my camcorder. I bought it a month ago, one week before I was hired at RadioShack. I want to sell it for $250 the 2 things that it wont include is it's outdated frequency book, and the reciept. I lost the frequency book because I thought I would need it, and never used it. And the reciept is long gone in the garbage. Yes it's in VERRY GREAT condition. I hardly used it, and when I did it just sat next to me on the couch. Enough about the boring stuff though. The Bear Cat 3000 XLT mfg. by UNIDEN is the top of the line scanner. It costed me $360. I want to sell it for $250 that's well over $100 off. I can ship TODAY. I will only accept CASH or Money order. NO PERSONAL CHECKS. I have had to turn down many people because of that. I have had 2 bad experiences selling my Palm II and Planner over the internet and accepting personal checks. It's not too much to ask, go to your postal office and get a money order! Infact I will wave the shipping fee if you do get a money order! All right I guess I'm getting a little boring here is the picture.

Contact : bret@reggaejuice.com

The official site for my scanner if you want to know what features it has. http://www.uniden.com/docs/product/prdetail.cfm?product=BC3000XLT

>
I did the mod to a new, just received unit, saturday and it worked
great.
I will try to get the serial number and post it.
This is the 4rth that I have done and all worked without a flaw.
I am not going to claim that all PCR1000s can be modified and I was
unaware that there were reports that the mod did not work on some newwer
unit. I suspect that this will be the last mod I do because the risk
of damaging the radio is just too great when faced with the liklyhood
that the mod will not work.
Thanks for the information.

4710. Re: What is an ambulance chaser?

Newsgroup: rec.radio.scanner
Date: 1999-09-20 00:00:00 UTC
From: elgtr1@aol.com
Message-ID: <19990920151612.20401.00000061@ng-fc1.aol.com>
Source record: 106579

An ambulance chaser, traditionally, is a lawyer that makes all scanner owners look bad, as previously mentioned.

However, there are also people like public Insurance adjusters. They are in it to make money, as well. However, they offer a valid service. They will represent you against your insurance company should your insurance company try to settle your loss for under the value of actual recovery.

Also, following this train of thought, construction companies are now getting into scanners. They are looking to "aggresively market" their product. Again, they offer a valuable service. These companies arrive at fire, flood, and disaster locations, ready to assist you with their knowledge and experience. In the case of a fire, they will board up and secure your property to prevent further loss or liabilty. These construction companies also provide valuable help in rebuilding after such a loss.

To sum up, not all ambulance chasers are lawyers out to meet you at emergency rooms, or to make scanner owners look bad. There are those who use scanner technology to help others, as well.

Howdy,

You are invited to my non-commercial, sometimes boring, hopefully useful, and always-undergoing-updates website. The URL is http://hfradio.org and features DX information, including QSL Route/Manager Lookups and Callbook Lookups; Propagation Center including the eAlert service (allows you to sign up an email address to the automated email propagation reports); Equidistant Azimuth Map software (allows you to create maps of any QTH); Swap and Shop; Bookstore (I've hand-picked over a thousand book titles on radio, etc.); Free website space for YOU to create your own Ham or SWL site, and there's more. Easy to navigate. Open for suggestions.

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

An ambulance chaser, traditionally, is a lawyer that makes all scanner owners look bad, as previously mentioned.

However, there are also people like public Insurance adjusters. They are in it to make money, as well. However, they offer a valid service. They will represent you against your insurance company should your insurance company try to settle your loss for under the value of actual recovery.

Also, following this train of thought, construction companies are now getting into scanners. They are looking to "aggresively market" their product. Again, they offer a valuable service. These companies arrive at fire, flood, and disaster locations, ready to assist you with their knowledge and experience. In the case of a fire, they will board up and secure your property to prevent further loss or liabilty. These construction companies also provide valuable help in rebuilding after such a loss.

To sum up, not all ambulance chasers are lawyers out to meet you at emergency rooms, or to make scanner owners look bad. There are those who use scanner technology to help others, as well.

Make sure your squelch is turned down just before it breaks static.
Also, make sure the frequencies your scanning are in use in your area.
If your frequencies are valid, possibly the bnc connector inside the
radio has lost contact. Beyond that, can't help you. Also check each
frequency and make sure they are not locked out. Good luck.

>the cradle).

Because I strongly suspect there is only one code! Yes, it's over a
billion bits long. The only question is timing. When did you start
the code?

A friend of mine recently reported to me that with a spread spectrum
phone he was able to pick up several other neighbors within half a
mile merely by disconnecting the battery and waiting to see *when* the
phone locked up.

It ain't hard to monitor if you have the right gear, folks...

Is there some "realistic" reason why Radio Shack cannot sell
batteries
to an un-named person? I don't want to get on the mailing list again,
and
my local stores(2) insist on a name address, phone, etc. in order to
purchase
the smallest item.
I've been told that it is their return policy that forces this.
However, I have
returned items with a receipt and no name, and I have been unable to
return items with a name and no receipt, so why bother.
I live in the Oregon "outback", so electrical stores are few and
far between, but dealing with these people has been more difficult than
it is worth. I have had prices change while I was in line. I have
purchased batteries that were dead when I left the store. I have been
harassed and hassled so much that I will drive to another town, or deal
with someone else by mail(or net).

Geesh, what is so damn hard about saying "REFUSED" when
they ask for your name and address?

If the clerk gives you grief, ask he he'd like you talk to the manager
and EXPLAIN that you don't want to give your name and address.

If it's the manager, ask him he'd like to get his 'district manager' on
the phone and explain why you don't want to give your name and
address.

Geesh, all they have to do is hit a SINGLE KEY (it used to be
<F6> on the one Store System) and then it bypasses the
name and address.

4727. Who is on this freq? What did I hear?

Newsgroup: rec.radio.scanner
Date: 1999-09-20 00:00:00 UTC
From: Toscano <toscano2@ix.netcom.com>
Message-ID: <7s4091$aif@dfw-ixnews7.ix.netcom.com>
Source record: 106633

At around 0005 this past Thursday or Friday morning,
I was doing a VHF search with my PRO62 when I encountered
what sounded like military traffic on 44.46MHz. I know
this is a cordless phone freq but what I heard was clearly
two stations communicating; although it was not too clear
I could tell they were observing military protocol (I am
in the Army National Guard, it could have been an Army
unit...) and it was probably coming to me from skip.

I live in central MA and I do my VHF monitoring with a 22'
custom-made antenna mounted 38' above the ground, I have
picked up many military bases before (Ft. Bliss and Leonard
Wood especially) but I am not sure if 44.46 is a setting on
a military radio or not. I think it is on the PRC77s and
similar sets, but I just can not be sure.

Any ideas? Thanks!

Todd, I am sorry if I misinterpreted what you said (and your original post *was* referring to local & state statues, as I see now that I re-read it), but what I am trying to ascertain is whether the media is exempt from the ECPA and the folks that previously maintained that they were exempt kept backing off their claims of which laws they were exempt from and it got confusing.

Now that we have even the hardest core of them admitting they are not exempt from the ECPA, I would like them to show me why they are not lawbreakers by divulging (and selling) 3rd-party information heard on *any* of the frequencies (forget cell for now) such as business band, mobile phone, fire, police & city services. I don't see how they can avoid admitting that they listen on these frequencies and sell product based on printing or broadcasting what they hear.

Of course the first excuse will be that, yes, they did hear X about Y on band Z, but they didn't use that. They called up Y and wrote the story based on what Y told them. Nothing to do with scanning at all. All good footwork and research on their part. And the 2nd excuse will be that the police, fire etal give them permission to print or broadcast what they hear. And I know that this 2nd one is true because the police furnished the crypto for the newspaper I worked for.

Now, as to what typically happens on a regular basic, here's a sample:

The photographers are the group who usually have the scanners running constantly and pay the most attention to them and since the newspaper management hasn't told them that listening to cell traffic is illegal--and remember, some or most of these guys aren't hobbyists like us and are just handed a scanner when they report to work--they listen on the cell band. Of course they eventually hear something newsworthy, local cluelessness about cordless and cell transmission being what it is.

One incident I remember was in a high-profile local murder case where the accused made a call to a lawyer on a cell phone and the lawyer was obviously training him how to act like he was mentally unstable in preparation for an insanity defense. The photographers of course carried the scanner out to the City Editor (who was no more aware of the law than they were) but who was aware that he couldn't just record this conversation and bung it into a story. So he calls the lawyer and of course get a no comment. But then he has someone write the story anyway using 'reliable' and 'unnamed' sources. The story is published in the newspaper and people buy it.

So has the newspaper sold information they heard on the cellular call? Not directly and they would probably have the defense that the photographer was not monitoring on 'official' time or was monitoring as part of his job or they would just claim the exemption they *do* have and no one argures with--the ability to keep their sources secret. But the bottom line remains that they sold the story based on what they heard by monitoring the cellular band.

/guy

Prior to the merger of the Land Mobile services, 44.46 MHz was allocated to the Motor Carrier service, with a specific restriction to "common and contract motor carriers of passengers within a single urban area", with the notation that it is also assigned on a secondary basis to cordless phones.

Could that "military protocol" have been a well disiplined bus service, such as an airport shuttle? The closest government allocations would be 41.015-42 and 46.6-47 MHz.

John Moran wrote:

> i took along two of my scanners on a recent trip from Phoenix to Los
> Angeles.

A few years ago I listened for a whole Chicago-Oklahoma trip on Southwest. The Captain not only said it was okay, he gave me the Departure frequency, and asked how I did after we landed!

Since then, several airlines I've flown have announced "no radios" during safety briefings, and the pilots have given a stern "no." The others allow radios after the climb and before the descent, but one flight attendant saw my radio and told me those were specifically prohibited. I figured it was just extra caution.

But when I posed the question on this forum a few months ago, a commercial pilot gave me a serious verbal whipping. He said I was lucky I didn't 1) get arrested, or 2) get a closed-casket funeral. He said he's experienced several dangerous malfunctions of navigation equipment and autopilot, problems that cleared up the second a consumer electronic device was turned off.

So I don't know what to think. It's hard to believe the tiny amount of RF emitted from a receiver could totally overwhelm the triple-redundant systems of a jet airliner. I'd like to see some tests done with specific radios, Game Boys, laptop computers, etc. But I've put my scanner away on flights ever since. Just in case it really is a danger, and in case they really would arrest me on federal charges and take away my radio.

Dave

Ch 1 is the primary Mountain Rescue Frequency.

Ch 4 is a shared frequency which Mountain Rescue has access to.

The Lake District has extra frequency allocations which are not allocated to
the rest of England and Wales

Ch 5 is used by RAF Mountain Rescue teams and Civilian teams do not have
direct access to it.

I need to know if I can unblock the Pro-91 for full-spectrum capability. I got mine open (with some difficulty) and can see a pair of diodes, marked D17 and D28. Will taking these off the board open up the rest of the spectrum? Please reply by E-mail to dhertzman@worldnet.att.net. Thanks in advance for any and all advice!

Ahhhhh......the good ol' LM1800 (or the ECG-801). Audio at 31.5 KHz subcarrier and the horiz. sync at 1/2 that frequency. That was the old Blonder-Tongue (blunder-tongue) descrambler like what ON-TV, WWHT 67 and WQTV 68 used. Those were the days....from TV audio out through an LM 324 op amp, to the LM1800, the sync signal pilot then went through a 96L02 dual one shot to a diode in-line through the UHF RF signal to trigger a 15.734 KHz pulse, fooling the RF into thinking there is a sync pulse thus making the video normal. Then to get program audio, you went from the LM1800 through another LM324, through a LM386 audio amp back to the TV speaker. My old circuit worked very well back then...

So many people I knew built that circuit there were probably more bootleggers watching StarCase that actual paying subscribers...

>If your friend truly had a SS phone, I don't believe this.

What it requires is a certain density of users. Given a certain
amount of clock drift, you will eventually encounter a DSSS signal.
The secret is that if the code is long enough, a drift will take a
certain amount of time to catch up.

This problem is helped if you have a neighborhood where there are more
than a few of these things in use. Then you may encounter a neighbor
after only a few minutes of drift.

>"targets".

Sigh. Tell your demo folks to read an introductory book on electronic
warfare. It's VERY easy. All it takes is a *pulsed* signal (not
audio modulation on the DC bias of a gunn diode). There is also a
region known as the "burn-through" zone where the radar energy
returning can actually be greater than the jammer. This explains why
you were able to see the echo at only 20' away.

>No iff we had the equipment so that we could have tunned the "jammer" to the

>I doubt it and suspect that jamming with any thing most of us could build is
>just not realistic.

Again, go read a book on Gunn-plexers. The front end is nothing more
than a single mixer diode in the waveguide. The return signal is VERY
weak: The path loss is related to the fourth power of the distance.
Meanwhile your signal source has only distance squared as a path loss.
If you can induce a carrier in the front end of the cop's radar,
you've won.

I've tested these ideas in a lab, many years ago, with my own gunnplexers. It's conceivable that a cop's radar gun might use a few DSP tricks of their own to evade jammers. However, I doubt there's much of a market for that sort of thing because it would be so expensive.

>And LIDAR is even more imune. Some surveying transits use LASERr that

>a highway.

If the front end of a LIDAR is preselected by a diffraction grating, I can see why this would be the case.

>Lets face it, jammers only help the seller. They get your money and
>you get nothing but a nice box and if you depend on the magic box, a ticket.
>IT is YOUR money and your choice.....

Quite true. Most jammers sold today are quite ineffective. Those which are effective generally get shut down before they can sell very many.

> by labeling him as one in a public forum.
>
No, he has not been convicted of theft yet. As a police officer, I can call someone a "thief" if I have observed the actual act or have positive knowledge of the person committing the act, in this case, I am the victim. David Munroe committed the acts of theft of movable property and theft by deception according to US and Canadian law. As the actor in the incidents, the Rules of Criminal Procedures call the actor a "thief". Also, for a "libel" or "defamation" suit to be filed, the plaintiff would have to prove I was grossly negligent in my remarks which in this case, all I would have to do is submit the 17 signed statements I have from the other victims and the civil complaint would be deemed "merit less". Also, the chances of him even getting a civil complaint granted in the United States is slim to none because of civil jurisdiction clauses.

the same instructions can also be applied to the Uniden BC245XLT... The
case comes apart a bit easier than the PRO 91. The chip location is
slightly different, also the speaker connector is in a different
location and MUST BE CAREFULLY UNPLUGGED before separating the PCB's..
And take care not to stab yourself with the butter knife :-)

I am wanting to know if this scanner is worth keeping.

Pro 2036, 800 mhz, not modified
200 ch.
CTCSS board installed
Turbo scan
auto log and counter

I believe Uniden made this one; does anyone else have thoughts on this one?

Remove "_nospam" from my e-mail to get a hold of me, thanks!!

>returning can actually be greater than the jammer. This explains why
>you were able to see the echo at only 20' away.
>

Sorry to disapoint you, but we also ran the unit in pulse mode. The Gunn
diode is powered by a uA723 regulator and it was easy to turn it on and off.
Again no difference, we pulsed it from .1 through several 1000Hz. After
retuning it down to the 10GHz ham band the unit was put in to service as a
point ot point (with another identical surplus police radar) private
packet link.
No it is true that we did not explore every posible PRR and duty cyclce,
but after 2 eveninings of playing with it, we grew tired and moved on to
more productive wastes of time.
My 6mter mobile had a lot more effect on the real radar than anything else we
did. 100Watts at 1000' drove it nuts. But I suspect that was a design
flaw of only that particular model.
No if I could generate 100 to 1000 watts, that might be usefull, if I did not
blind or cook myself.

The Pro 2036 is the Uniden BC 890 XLT with the Radio Shack logo on the case.
I have one and like it. Very sensitive but prone to images. This model
covers the milair band. If you don't need a trunk tracker it's a keeper.

Are those a bad thing? I personally like knowing what's on sale at Radio Shack; it's saved me hundreds of dollars over the years. For all the grousing on this NG about being charged for catalogs (which my RS never did), it seems it would actually be a service to get miniature versions of the catalog hand-delivered to my mailbox.

The best person to ask is the Captain. Most airline attendants (as they
prefer to be called nowadays) will gladly ask him/her if you say something
along the lines of "Can you ask the captain if I may use my scanner on this
flight?"

Don't just ask them. You're right they are clueless. Chances are they will
say it's fine without even asking the captain. You definitely want the
decision in the hands of someone qualified to make it.

After all, it is 35,000 ft to the ground....

>OR EMAIL ME AT A99B921E@MAILCITY.COM THANKS.

MORE IMPORTANTLY, HAS ANYONE WRITTEN A PROGRAM TO TURN CAPS LOCK OFF? THERE HAS TO BE A WAY....

Seriously, it's obvious to me that you have not bothered to do any real research into the very idea. If you had you would know:

1. It's illegal to do it in the US, and it's illegal to sell such a device in the US. So there aren't too many of us (myself included) that would spend so much time figuring it out knowing that A. I can't make any money doing it and B. I could get in some SERIOUS legal trouble over it. Sometimes the thrill of the chase is enough to warrant some disregard for items A and B but in this case, no.

2. Each phone is different. Each manufacturer uses their own proprietary format. There is no standard. Furthermore, varying models themselves have different protocols. Some may offer more enhanced security features than others, and new ones are introduced every day. It would be a monumental and never ending task to write one program for all of them. I'm not just talking to hear myself talk here either. I write programs for a living - I know.

3. The encryption methods for these phones varies as much as the protocol used does. This is to prevent someone with the same exact brand and model of phone that you have from making calls on your line. Makes sense... Now consider that this crypto or "key" if you will, changes everytime the receiver is placed back in the cradle. That means this program will have to find it each time it detects a signal - that could take days. I'm not going to get into the technicalities - that is a book unto itself, and I don't feel like writing a novel tonight.

But as I say, if you had researched a little further on your own, you would get the idea. Sure it's theoretically possible. So is bringing the dinosaurs back to life. That doesn't mean it's been done, or likely ever will be.

One more thing about the flyers and the RS database. RS sends a
birthday 10% coupon to me every year... I just bought an RCA
DVD player and used the coupon to save $25. Not a bad deal
for just giving them my name and address when I purchase stuff.
Especially since $250 is a good price for this DVD anyway.

Dan,

I think some of the jargon from 11 meters is finding it's way onto 2m. I don't
particularly care for it. However, I'm much more concerned about guys running
FM simplex on 144.200, 144.100, etc.

My .02

Eric

Todd,

I have not done any "extensive" research, but I did do a cursory check of Illinois Compiled Statutes. I cannot find any statute prohibiting scanner use. My cursory check involved checking the Illinois Vehicle Code and asking around the squad room. I was going to ask the Assistant State's Attorney on my last court date but quite honestly forgot. Sorry. If I remember on my next court date, I will ask and post his response.

From: scannerhead@my-deja.com
Message-ID: <7s6lobcrn1@nnrp1.deja.com>
Source record: 106511

What is the best way to improve 900MHz performance for handheld scanners? I have a max-800 antenna but have never been impressed with it. I need more. What can I do to pick up the weaker signals? Can any one recomend the signal preamps made by JIM or are they a wast of $$$? I live in a condo so outside antennas are not an option.
Thanks.....

Message-ID: <7s76bknmu1@nnrp1.deja.com>
Source record: 106512

Hello all!
I am interested in getting a scanner for my pc and have browsed around to see what is on the market.
I am looking for a scanner that can scan in the range of 150 KHz - ~2GHz, or somwhere in that area. The tops that I can afford to spend is $500. Is this a possible equation? I looked at the specs of Winradio's scanners for pc, and they seem quite good, like WR-1000i! But they only go to about 1.5GHz.

So does anyone have experience of a good scanner with similar specs to above that I can get for my pc (should be a fairly common one since I live in Europe)?

I'll second that, my MVT7100 sounds better than any other I've tried, rich and suprisingly very "bassy" for such a small speaker. No distortion even at quite high volumes. Even when put through my home stereo system, although in mono sounds great.....well you get the drift, I kinda like my 7100!!

The best response that has always worked for me is "No Thank You" when I am asked for my name. This has worked for me in every RS I have purchased from. Try it and be sincere when you say it...it really works.They have never questioned me further.

When they ask for name just say (like I do) "If I'm not in the
database forget it and just do the sale. If they refuse to sell to
you, tell them "fine, I'm sure you're headquarters will love to hear
about this then". Then head for the door. See what happens.

I go into 5 local shacks here where I live, about 5 times a year
at least. EVERYTIME I buy something they need to re-input my info. I
got sick of it and now say forget it. If they can't get their shit
together that's THEIR problem, not mine. Either their computer system
sucks or they blow out the databases on a regular basis. Either way
I'm tired of it. IF enough folks refuse they will have to change the
way they do this nonsense.

Tom

Has the radio been modified for the locked 800 band?
If so, the re-solder of the antenna connector may have been
'forgotten' or it may have been sub standard and came loose.

Remove the back cover and look at the inside end of the antenna jack.
there is (should be) a short bare wire from there to a hole in the PC
board. (middle board?) Check for bad connection there.

Good luck... LCM

No. A radar detector is a receiver, and jammer would require a transmitter.

It is best to avoid using any cordless phone.....because of
frequency bleed over. In other words it could be heard in other bands.

As mentioned in another post it could be the antenna connector, there is also a chip capacitor that could be bad from heat or just move when soldering. It's on the back side of the board.

My neighbor has the same Uniden SS phone that I have. It does use unique security codes and resets them each time. I tried an experiement with his handset in my base. I forced the synch up and my handset no longer worked.

>A friend of mine recently reported to me that with a spread spectrum

If your friend truly had a SS phone, I don't believe this.

Right - but nobody does (yet).

4821. Re: FS: Best Portable Scanner Antenna!!

It is hard to jam police radar.
I saw a demo where a guy used a surplus X-band police radar unit as a
"jammer".
He tried white, pink and audio tones and with a friendly police officer
showed that none of them had the slightest effect on the real cops
radar. Now if the police officer turned up his audio we could hear
the "jammer", but it had no effect. Same capture point (about 1/4 mile),
even when he pointed the "jammer" at the working police radar it from 20'
awy it would not mess up the readings on either oncoming or departing
"targets".
No iff we had the equipment so that we could have tunned the "jammer" to the
exact same freqeuncy as the real radar (while the are supposed to all tune to
10.525GHz, they are spread out like 10.5251 and 10.5252) it might have
helped.
I doubt it and suspect that jamming with any thing most of us could build is
just not realistic.
And LIDAR is even more imune. Some surveying transits use LASERr that
have the same basic electronics as LIDARS and even use the same 1000Hz,
30nS pulses. Pointing such a transit directly into a police LIDAR, from
100', did not effect the LIDARs ability to measures the speed of cars on
a highway.
Lets face it, jammers only help the seller. They get your money and
you get nothing but a nice box and if you depend on the magic box, a ticket.
IT is YOUR money and your choice.....

There are very few signals in the 1 to 2 GHz range. I have a surplus
military 900 to 2300 radio that while nice and sensitive, is not all
that usefull.
Unless you are certain that really need the 1 to 2 range, You might be
better off to live with either 1300 or 1500 as the maximum.
I like the Icom PCR1000, but the Winradios are nice also. None of the
broadband radios are as good at the low end as a dedicated SW radio.
If you plan on serious LW/MW/SW operations, where you are going after
very weak signals, then none of the broadband radios will work as good
as say the TenTec RX320.
Good luck and you will enjoy whatever radio you choose.

4827. Alinco DJ-X10 vs Icom IC-R10????

Newsgroup: rec.radio.scanner
Date: 1999-09-22 00:00:00 UTC
From: "P. Goddard" <zeiro@mindless.com>
Message-ID: <37E81A73.29DA1D05@mindless.com>
Source record: 106350
Cross-posted to: rec.radio.scanner,aus.radio.scanner

I've been trying to decide on my next scanner for a while now. I was thinking about a MVT9000 but they're a little too big and a little out of my price range. Yaesu's VR-500 also caught my eye but getting hold of one here in Australia is proving to be very difficult. My other choice was the Icom IC-R10 (slow scanning doesn't bother me too much). While looking for a good price for the R10 I stumbled across Alinco's DJ-X10 which looks like quite an interesting unit. Reading reviews around the web it seems like it's a fairly even match for the IC-R10 and I'm just curious as to which radio people seem to prefer and why.

Prices for either unit here are almost identicle and size isn't a major factor.
Alinco has faster search at 25 step/sec which is attractive considering the R10's search speed is 17 steps/sec.

The other main considerations for me are:

Durability, (I take my scanner everywhere)

Interference rejection (I never know where I'll be listening and home is fairly RF intensive (but my R2 is almost good
enough so it doesn't need to be perfect).

Performance from 60-80MHz and 108-500MHz (only use 800MHz for listening to cell phones and I never use HF, I have a good SW rig for that)

Ability to connect to an external power source such as an ac adapter. (something I hate about my R2)

Looking forward to seeing what people have to say.
Thankyou.
Paul.

The reason I ask is because your survey inquires more than once, about the mod, which mod, etc. I'm sure the FCC would like that information, just as the ATF collected a list of people who own SKS rifles... then went door-to-door, demanding that they be surrendered. It's not an unheard of tactic these days! No, I'm not paranoid. I don't even own a PCR-1000 at this time.

And yes, I have seen a black helicopter, this evening as a matter of fact. The city of Warren, Michigan Police department uses one, every night.

4841. How to scan digital radio

Newsgroup: rec.radio.scanner
Date: 1999-09-22 00:00:00 UTC
From: Frogatan <kungen5288@my-deja.com>
Message-ID: <7sars2cnd1@nnrp1.deja.com>
Source record: 106364

Hello!
I beleive following is possible but I don't know how it would be done,
and I am interested in knowing how:
Is there a scanner that is able to scan digitally encoded waves, such as
mobile phone waves (gsm and such).
If there is not a scanner that can do this, is it possible to make
something oneself? For example, to have an antenna, an amplifier that
amplifies the received waves from the antenna, and then feed these
signals into a computer which applies some algorithm to the data to
encode it, and then spits out the encoded data (eg. speech)?

I am interested in broadening my understanding about this, if anybody
has some information, could you please post here or email me directly?

If you're not interested in HF freq's, then you could probably get a better handheld than the ones you've been eye-ing, if it's a dedicated VHF/UHF scanner.
Take a look at the Uniden BC3000, it covers the freq's you mentioned in AM, NFM and WFM. The scanning speed is faster than any of the radios you mentioned, and my experience showed me that it can handle intermod and interference quite handily. (I live about a half-mile from a pager/cell tower and get almost no noise from it on the 3000, even though it blasts the hell out of my lesser scanners with bleeps and buzzes all over the bands!)
I know there are others out there, but perhaps someone with better experience than I can help you. Good luck!
Mike

I need to know if this scanner is worth anything....any opinions from the "experts" in the group sincerely appreciated....what it's worth...compared to a BC8500xlt or a Pro64....thanks,Tom

Try to find one of these!
Lucent Tec. Model 9510, 900mhz,digital encoded, switches 200 times a second
using 177 channels out of a random 200 channels each time the phone is used.
Retail price was $349 us Regards Richy

There is NO prohibition against using a scanner in Illinois, mobile, portable or otherwise.

In Chicago they have an ordinance against using a scanner in the commission of a crime.

Doubtful. X-band is at 10 GHz, K-band is 24 GHz, etc.

Most likely the frequencies mentioned below are for
microwave relay stations. Little chance for most
hobbyists to intercept, let alone decode any of that
info.

[...]

I really haven't heard much other than images above 941 MHz on my AR8200 (handheld) here in RF saturated NYC.

I too am looking for a good trunk tracking base scanner. After much consideration, I think the best bet is to wait until November 15 and get the RS PRO-2052. According to its specifications it seems to have just about everything I'm looking for:

1,000-channel
Follows analog Motorola I, II, I/II, and GE/Ericsson (EDACS) trunked systems. Extended coverage includes 225 and 1,240MHZ Ham bands.
Built-in NOAA weather radio alert with "SAME" (no display).
Built-in RS-232C serial interface permits computer control, uploading, downloading and cloning. 20 priority channels. Data skip. Search skip.
Covers 29-54, 108 174, 216-225, 406-512, 806-960 (excluding cellular) and 1,240-1,300MHz
Price: $369.99

Correction here. The Pro-2052's coverage is actually 29-54, 108-512,
806-906 (minus cellular), and 1240-1300 MHz.

Posted by Chris A on August 29, 1999 at 23:52:04:

does anyone have the IF frequencies for the BC245XLT..I couldnt find them

in the manual or anywhere else...

also i noticed that if you hold down 2 and 9 and certain other buttons
when turning on the bc245 it does different (undocumented) things
heres what ive found so far:

hold down 2-9-x when turning on:

x=
(man) - Reset scanner *Erases All Memory*
(scan) - Loads Test Frequencies into bank 1
(4) - I believe it gives off firmware version information
i got a alternating (1.17 and EE96H)
(trnk) - Loads test frequencies
(7) - lcd shows err in left corner and lights all bank indicaters
(svc) - more test frequencies
(.) - lcd shows an H if you press dly it switches to L and press it
again it shows H again..if you press data it beeps but nothing changes
(0)
OR (E) - ALL LCD segments are shown then when you push a button it loads
test frequencies into memory
(pri) - loads test frequencies and starts scanning in the air band
(limit) - loads test freq's and scans between 511-512 mhz
(srch) - loads all 300 channels with freq's between 144-150 mhz
(hold) - same as srch
(DLY) - lcd shows 3 sets of Hex numbers changeable by (.) (limit) and
(hold)
I have no idea what these do
(l/o) - loads bank 1 with 173-174 freq's
(data) - same as l/o

Microwave Relay stations... My Sheriff's Office has them too.
Each control point has a microwave link to the 800mhz Smartzone
Trunking. those are in the 2 ~ 4 GHz range. Ofcourse you have
to be in the pathway to pick up the signal, or be real close
since its pattern is so directed.

Here are some things you can find up in those ranges:
TDMA Cellular
GSM
Satellite
Microwave Relay Stations
Experimental and Testing
Amateur

In otherwords not a whole lot, GSM and TDMA are both digital
so listening in to them is a waste of time, if your lucky
you may encounter satellite signals but I'm unsure of what
you would hear, and with microwave you have to be real close
in or directly in the pathway of the RF. As for the other
stuff, well just scan. Personally, I wouldn't get the 895
or the 235 trunktrackers. I'd go for ther new 245XLT, its
a much better scanner, and has SEVERAL trunking improvements
over the original trunking scanners, and I'm not just talking
about EDACS either. If you want a big bulky desktop scanner
wait for the new Realistic to come out and look into its
capabilities, it most likely will far surpass what the 895
has.

none@sorry.comm hath said:

Source record: 106381

Hey, three times a year I get a letter from Radio Shack giving me
10% off the bottom ticket line. I'd say that's worth it. I got my
Nokia
Cell phone for just over $60 when they were $100 because I had a
$20 certificate, a 20% sale certificate, and then the 10% certificate.
The $20 was 'cash equivilent' so it could be combinded with other
sales. The 20% was a specific Nokia thing. And the 10% thing
was a "no matter what, 10% on the entire ticket" coupon. I think
that day I bought well over $200 worth of stuff and the final bill was
about $140.

I know they hope you buy impulse items, but I had been trying to decide
on a cell phone for about 6 months and had finally decided on the
specific model. The coupons from RS and Nokia came in within
a one week period and clinched the deal.

And they used to give out flashlights at least twice a year, but I
haven't seen that for a while. Great way to get cheap flashlights
for the kids. Know how many 5-cell flashlights I had in my house
at one point?

Oh, I used another one of my 10% coupons to by my first HTX-242.
I was at a HAM show, and the ADI guy offered me their radio for $220.
Radio Shack said they'd meet the price, and THEN let me use the
10% when I pulled it out. Hmm, I don't know if they let me use it on
the service contract though, but I seem to think they did.

Mike

> When at RS?

The rumor is 10-15-99.

> Is there a Uniden version (if Uniden is the daddy)?

The Pro-92 radio scanner is manufactured for RadioShack by GRE, not Uniden. The Uniden BC245XLT can track both Motorola and Ericsson EDACS, but unlike the RadioShack Pro-92, the BC245 cannot follow EF Johnson LTR trunked radio systems and the BC245 doesn't have alphanumeric display.

> Any cheaper than than $369.99 anywhere else???

The RadioShack.com and the RadioShack catalog shows a price of $349.99. Since the radio is not yet on the market it is difficult to estimate what the real world pricing will be.

If the R10 uses a standard 10.7MHZ IF, then you might be able to lift the IF
and DEMOD section from a "standard FM BCB" receiver.
Failing that, find the discrimin out, the same place you would couple a
data slicer (like for decoding pogsag etal), check with an Oscope to make
sure that the 19KHz pilot tone, and the 38KHz L-R signals are there. If
so, look at the Motorola site for an IC stereo demod.
In short yes it can most likely be done, but you will end up with an ugly
outboard "decoder" box.
I have used the Stereo demod section from and old (25 years)Pioneer "super
tuner" automotive stereo with my PRO2004. If I still have the demod I will
try it on the PCR1000 as it already has a "data" out tap.
My wife read this and suggesting that you look into one of the el-cheapo
"Walman" knock offs that suports FM stereo (lables sometimes as MPX) and
try to use the IF(again is the R10 has a 10.7MHz if), or the stereo demod
and audio sections. They are cheap, small and already have the audio
section. Some of the Tandy older handheld scanners (Pro16 and Pro34 at
least), radiate thier IF strong enough to get into a poor shield/designed
"walkmans". I am able to hold the PRo16 up to my real Sony AM/FM/FM-MPX
and, with the scanner tunned to the local NOAA station, hear it weak but
very clear in the Sony. Commercial stereo signals are much wider than
most of the signals we listen to and produce much less audio after detection
than the wider signals.
Good luck and let us know how it works.

There are also some video signals in the 2.3-2.5 Ghz range. Most of these
are cameras mounted along freeways to monitor traffic flow, ect. There has
been some
talk of this on ATV websites and on a couple of the remailers. Most of the
reception
has been with the use of a Wavecom Jr and a small hand held TV with people
driving around major cities until they find something.

"mystar" <mystar1NOSPAM@earthlink.net> wrote:

:Is it possible to modify my R10 or any other existing scanner so that it
:can receive a stereo signal (in stereo)??

Yes it is, if you add the extra circuitry for the decoder. The stereo
coding used for FM radio is very differant to that used for stereo
TV sound. I had an FM mono car radio to which I added a stereo decoder
I built from an Electronics Australia article.

:I know some of you may wonder the
:point of this, but for my own knowledge I am merely curious if it is
:possible.

It's probably more practical to buy a seperate stereo receiver.

2 Meters is a radio band, within the Ham bands.

It is the designation for the 144-147'ish MHz area on the ham allocated frequency bands here in the US.

How is anyone supposed to know what bands you are talking about?

If it is 118-138 MHz you will hear them rarely,
if you have 225 MHz to 400 MHz you have an excellent chance
of hearing military communications.

Hi Bill,
I'm trying to find out around what serial number they (FCC) put a stop to the simple eprom mod. I have found so far that at least 2400 of them made it through and I have one of them.
I don't work for the government (not at this time anyway). I'm a scanner nut who simply want to know all that I can possibly know about the receivers I own.

My Survey doesn't ask for a name nor does it ask for an exact serial number. Heck Icom knows all this information already and I'd bet the government does too! If they want you.... they will get you. Do you really think they would waste there time making webpages and posting in the newsgroups.

>blind or cook myself.

Interesting. That's not what I saw in the lab. I used a straight 50%
duty cycle on a gunnplexer Gunn Diode and I was able to induce a
substantial signal in the detector of my test unit. After all, that's
how those "radiation" radar detectors work.

I used this as a demonstration to myself while I worked at the Naval
Research Lab as an intern (at the electronic warfare division), back
around 1981.

I don't mean to be pedantic, but I believe most police radars on K
band, not X-band. Are you sure your radar wasn't a K-band unit?

The six meter interference business was more likely a problem with
poor shielding around the diode input to the radar baseband.

Hi there !

I have AOR 3000 A radio scanner.

I wanted to make discriminator output in the back of my radio.
When I spoke with aor tech support guy he said something
about WFM AND NFM disciminator output.
He said he can't make for both modes. Does it mean if he
makes for NFM ,(where most modes are transmited at)
that I won't be able to receive to receive sattelite pictures
{137mhz } that are transmited in AM and radio has to be
set to WFM ???

I was also looking for MC-3357P chip inside my radio to
make this discriminator output , anybody knows in which part
it is ?
And if I did it , would it be NFM or WFM discr. ?? taken from
leg 9 of this chip ?

Also I am going to exchange my IF filter from 15 K to 20 or 30 K
, would this have any negative effect on my radio ?

Thank You so much for your response.

Barbara :-)

The batteries cannot be charged while in the R2. I always carry a pair of
charged batteries in my pants pocket along with my R2, plenty of room for both
sinct the R2 is so small. The R2 has humungus audio which eats batteries. I
can't get a full day on a pair of 700mah cells.

>amplifies the received waves from the antenna, and then feed these
>signals into a computer which applies some algorithm to the data to
>encode it, and then spits out the encoded data (eg. speech)?

Sure its possible. In fact, monitoring MDT's, the minicomputer terminals in police cars is gaining popularity using this technique.
Pretty much the way you explain..The "antenna" and "wave amplifier" would be a scanner that receives in the range of the target signal. The scanner intercepted signal can then be fed into a computer and interpreted, assuming you use the correct receive protocol (digital signal 'grammer') and the data is not encrypted. If it is encrypted, you are probably out of luck.
Additionally, your scanner will probably need a slight modification to receive data. The scanner circuitry is tuned to monitor voice transmissions. Frequently, non-voice signals (like what you are interested in) are filtered out so as not to detract from the voice performance. This modification varies from scanner to scanner, but generally involves soldering a lead to a pin on a chip. This lead supplies the digital signal to the computer, and the rest you know..

Hi,
Have a look in the message board on eavsdroppers site. Someone posted this question and I've replied to it there. The discriminator o/p will only exist when the radio's in wfm of nfm modes, because I think the IF is switched to the AM / SSB demod part of the 3357. The difference between WFM and NFM in the 3000 is the IF filtering. The WFM uses a 10.7mhz ceramic and 2 mixers to convert the 45mhz if to 10.7, pass it through the filter, then convert back to 45mhz. The nfm uses a 45mhz filter I think.

Mail me if you want more specifics.

Regards,

Paul.

Where do you live? I may be able to help you, although you will be limited by the capabilities of your radio. The Pro-90 is not really suitable for milair monitoring. To monitor military aircraft you need a scanner capable of tuning the 225-400 UHF airband (the Pro-90 does not) and it must be able to receive 138-150MHz in AM mode (the Pro-90 cannot).

For 20 dollars, either buy the wireless fm transmitter and plug it into the headphone jack or if you have a tape deck simply put in any CD car adapter that plugs into the tape deck. the sound is great and you do not have to dismantle the doors!!

> how those "radiation" radar detectors work.

50% duty cycle will work but a FM Sawtooth is much better for jamming
police radar. Tune to the center freq and they sweep the signal. The
radar unit sees the return as something rapidly accellerating and
decellerating causing the display to remain blank. It works very well.
The previous poster simply has no idea what will and will not jam radar
or laser. Both are very easy.

> I used this as a demonstration to myself while I worked at the Naval

I used to work with those guys and their EP-3's;) I did EW for 6
years...what fun:))))

> I don't mean to be pedantic, but I believe most police radars on K
> band, not X-band. Are you sure your radar wasn't a K-band unit?

Depends where you live. There are 3 bands, X/K/Superwide Ka. Ka is
becoming more popular but if we were to do a raw count I'd have to
beleive K band would be the winner with X close behind.

4902. Listen to the easiest amateur satellite - FO29

Newsgroup: rec.radio.scanner
Date: 1999-09-22 00:00:00 UTC
From: "KF4FDJ (Mike in Fort Myers)" <seven77@gate.net>
Message-ID: <37E99AC1.BDEEDD3F@gate.net>
Source record: 106425
Cross-posted to: rec.radio.amateur.space,rec.radio.scanner

Since FO-29 is now (BACK) in digitalker mode, I am distributing this FAQ to the space groups.

Since the previous posts on working the FO29 digitalker, I have been asked several questions on how to hear the FO-29 digitalker. What follows is sort of an evolving FAQ. Feel free to distribute this document. KF4FDJ - September 22, 1999

The Japanese satellite, Fuji Oscar 29 (JAS-2), was launched on August 17, 1996, by H-II rocket No.4, along with the earth observation platform satellite ADEOS, from Tanegashima
Space Center of NASDA (National Space Development Agency of Japan). FO-29 is a small LEO (Low Earth Orbit), Japanese owned satellite containing a digitalker, mode JA transponder, and 1200/9600 baud packet capabilities. The mode JA transponder requires a SSB, or CW uplink signal on 2 meters, and transmits a downlink SSB/CW signal on 70 centimeters. Mode JA is a full duplex mode. You WILL hear your own downlink, which is crucial, in order to compensate for doppler. The satellite is also capable of mode JD, (digital) at 1200/9600 baud.

Q Is Fuji Oscar 29 always in digitalker mode, and what is it?
A The digitalker on FO-29 is a digital loop announcement, which makes the same announcement over and over. You will hear, "Ho- ho'kke'kyo, this is JAS two." The first part is the song of a bush warbler. JARL (Japanese Amateur Radio League), plans to cycle digitalker, mode JA, and mode JD. The digitalker message is subject to change. Check announcements on the BB for a mode schedule and other details.

Q Do I need a multimode rig to hear the digitalker?
A Since FO-29 transmits in FM mode while in digitalker, any FM or multimode receiver capable of tuning the 70 cm ham band should be able to detect the signal.

Q Do I have to use a high gain antenna to hear the signal?
A Digitalker operation dedicates most of the power budget of the satellite to the FM transmitter, instead of spreading it across a mode JA transponder. It is a very strong signal! It is possible to hear the satellite with a handheld scanner or transceiver, and a stock "rubber ducky" antenna. Most 70 cm base stations, or scanner listening posts, with fixed antennas, should also be able to tune the signal.

Q I've heard that a circularly polarized antenna is necessary to hear FO-29. Is this true?
A While a circularly polarized antenna will help on mode JA, it is not necessary with the digitalker. It REALLY is possible to copy the

signal with a handheld device and a "rubber duck" antenna. We have been successful with a Yaesu FT-50R and a stock antenna. You will need to rotate the rig (and antenna) for the best orientation. Experience shows that horizontal polarization, with the axis of the antenna perpendicular to the satellite gives the best reception. Experiment!

Q Where do I tune to hear the signal?
A The transmit frequency is 435.910. Of course, you will have to compensate for doppler shift. Just remember you will tune a little higher in frequency as the satellite approaches your position, and a little lower in frequency as it recedes. You will always be tuning higher in frequency when the satellite comes over the horizon. Make sure you have your radio set to tune small increments, as increases and decreases in doppler are gradual.

Q How long will I be able to hear the satellite during each pass?
A Since FO-29 is a low earth orbit satellite, most passes will be between 6 and 18 minutes in duration. Timing is critical in working any amateur satellite.

Q What is the purpose of the digitalker?
A The digitalker presents an easy opportunity for hams and non hams to have their first taste of real time reception of signals from space. Use this opportunity to show a kid, or a terrestrial ham how easy it can be to tune a satellite. This opportunity is excellent for scout meetings, monthly ham meetings, schools, or any place where inquisitive persons congregate.

Q How will I know when the satellite is over my location?
A You will need a program to generate predictions of when the satellite is "visible" to you. An excellent place to find downloadable software for real time tracking of satellites, and other information on the amateur satellite program in general, is:

http://www.amsat.org

Be sure to download the latest keplerian coordinates if you download a tracking program. Each prediction program needs these coordinates to determine where the satellites are, and to help you determine when FO-29 will be over your horizon. Another casual approach, is to use an online prediction site, such as:

http://acsprod1.acs.ncsu.edu/scripts/HamRadio/sattrack

This site will generate pass predictions for a selected satellite.

If you have any comments, additions, or modifications to this document, please contact me directly. We will attempt to post the latest version whenever the satellite is toggled to digitalker mode.

73, Mike KF4FDJ

I have a handful, so $10 each or two for $16, includes
postage.
Available from Radio Shack Unlimeted (RSU# 20-0057 and
#11451630) for $19.95, and originally manufactured as the
perfect fit for the Pro-60. Adapts extremely well to the
Pro-43, 39 and 64 models. Leather with belt clip and a
perfect rectangular cut out to expose both AC and charging
jacks on the side of the aforementioned models. Still in the
original Tandy wrapper, including silicate package to remove
moisture. Tandy introduced leather scanner cases in its 1997
catalog, which left the 43 and the 39 out. Wrap that rascal!

There is no external power jack at all on the radio, either to provide
operating current for the radio or to charge batteries.

Hi, I got a DJ-X10 about 6 months ago.
I found that very poor reception on HF with original antenna, but good on VHF & UHF.
The other problem is this unit not really user friendly. Bit hard to remember their function operation steps.
Anyway, is a good scanner, small size, good price($6??), average sensitivity good.
If you still interesting and want to get a 2nd hand one, call me......in Melbourne.
Selling price at around $3??. with extra antenna good for HF.

If you have any significant clock drift with the nature of spread spectrum,
the handset won't lock on the signal.

Therefore, any clock drift you speak of is insignificant in trying to lock on
a signal.

Care to try again?

Having played with a couple of the radios scattered around the web that
are controllable via web pages, I'm wondering where the controlling software
came from? Does anybody know of a software package, shareware or freeware,
to implement one of these things? Did these sites roll their own from
scratch? I've got a pcr-1000 sitting here and a web radio seems like a
neat project.

/* Begin Introductory Spread Spectrum Receiver Design Course */

The circuit most commonly used for this is called a Costas Loop. Your clock is based on a VCO connected to a quadrature hybrid to feed two mixers. These give you a baseband output called the I and Q channels (I for In-phase and Q for Quadrature: a fancy way of saying 90 degrees out of phase).

You limit the I and the Q channels, multiply them (feed them through a mixer) and then apply this output to a low pass filter. This will give you an error voltage you can use to steer the VCO back on channel. This error voltage is very similar to an AFC circuit on an FM radio.

By the way, the Costas loop is capable of locking up on all sorts of signals: AM (for synchronous detection), FM, PM, FSK, and so on...

Nearly all spread spectrum radios work this way. Only those who can afford a GPS disciplined oscillator or an atomic reference can stand a chance of staying in synch without such a circuit.

Now imagine what happens when there is no signal. The VCO gets to wander around. It drifts. It will continue to drift in phase until it finds something to lock on to.

/* End Introductory Spread Spectrum Receiver Design Course */

Now imagine your spread spectrum telephone. You have the same billion bit code on the same frequency. However there are ten users in your area using these things within range of you. Assuming a drift of several thousand Hz (not an unrealistic number at 900 MHz), eventually you could run in to another phone. It would take time, and a bit of luck. However it could be done.

Furthermore, I wonder if they really drift as little as that. I wouldn't be surprised to learn they use a VCO instead of a VXO. In

that case, you could be looking at a lockup time of only a few seconds.

Basically, an unlocked spread spectrum phone becomes a scanner in code phase instead of frequency.

Any questions?

I've just finished updating my website at
http://www.buffnet.net/~kny2vs/welcome.html

The main page above has been updated slightly. The News Page has been updated and some slight changes made to the amateur radio and HF Monitoring pages.

I've also added a "KNY2VS Reviews..." page where I will present reviews of various radio equipment. For the time being, there is only a review of the MFJ-1020B Active Antenna there, but I will add more reviews as I write them.

The Amateur Radio page in particular will be the subject of another, much more extensive update in the near future as I continue working on my modest contribution to the world wide wait...er, web. :-)

Let's set the cellular monitoring debates aside and start a new thread. This one is dedicated to all the stupid, foolish, misleading, and downright incorrect statements sellers make during online auctions. All meant in good humor, of course!

The first entry comes from Yahoo! Auctions site: http://auctions.yahoo.com/auction/8946230. This gentleman is selling a 2-meter mobile rig. In the description, he offers the following notice:

"When you bid on the rig, please e-mail me w/ your callsign so that I can verify you are a ham. It is illegal to sell a ham radio to someone who is not licensed. "

Nope. Guess again. Better go back to your Gordon West books.

Note: this address does not accept unsolicited e-mail. Please contain all discussion regarding USENET posts to the appropriate newsgroup thread.

How are you going to get around the security code feature that is unique to each phone? This "marries" each handset and base to prevent base use by another handset. This goes way back to the 46Mhz phones.

These phones do not just rely on the individuality of SS to keep conversations separate.

>Furthermore, I wonder if they really drift as little as that.

I don't see how that's possible. The phone wouldn't be usable if the drift was significant.

Go back and read what I posted. There is only one code. It is very
long (in the range of billions of bits). The starting phase is what
keeps you out of everyone else's hair. That's how they claim there
are a billion codes.

>These phones do not just rely on the individuality of SS to keep conversations
>separate.

Dream on...

>>Furthermore, I wonder if they really drift as little as that.
>
>I don't see how that's possible. The phone wouldn't be usable if the drift

Again, read what I posted. We lock in to the signal using a Costas
loop circuit. Doing what you suggest, even with high stability
oscillators, is unworkable. If you drifted even one bit off, you'd
lose the signal. This is very easy to do. That's why we use Costas
loop circuits.

I will argue no further. You need not believe a word I say. You can
plug the words "Costas Loop" and "spread spectrum" in to a search
engine. I'll be very surprised if you don't get a flood of hits.

Good Luck!

Given the choices above, I'd have to say the 8200, followed by the r10.

You might want to wait and see the Pro-92. Not as many bells and whistles as
the AOR, but the trunk tracking is nice to have.

Wow, you fancy yourself as having an "operations center," you forge your return address as being the non-existent radiodesk.gov domain, and to top it off, you've got one of those dumb "Registered Monitor" things. Your web site would certainly be fascinating, but I think I'll pass! ;)

4934. Multiple E-mail Addresses in this group/Fat Fonts

Newsgroup: rec.radio.scanner
Date: 1999-09-23 00:00:00 UTC
From: "Todd L. Sherman/KB4MHH" <afn09444@afn.org>
Message-ID: <7se2s3$b80m$1@spnode25.nerdc.ufl.edu>
Source record: 106314

No offense, but is there a REASON why I've got one person in this group filtered out with (so far) 5 different e-mail addresses (and increasing almost daily?)

This person uses a fat font that I can't turn off, or force off, except by completely exiting the newsgroup, reading a normal piece of mail in my INBOX, then reentering the newsgroup.

I've nothing against this guy, but, to keep my font settings the way *I* want them, I've filtered his e-mail name out. I do this not because I don't like the guy, but because its irritating to have to exit out of the group and then come back in order to restore MY font reading settings. But he keeps changing his e-mail names to something different. And he does this just about every 3 days on average now. I've no idea why.

So far, he's used/is using:

FULLMAILBOX
911COMMUNICATIONS
911RADIOCOMMUNICATIONS
THEMAN
G-MONEY

And I expect more will be added in the future. I've no idea why this guy seems to think it important to change his name so often. If he's trying to make people think he's a different person, his font gives him away right away, and you know right away its him, because noone else in this group uses it.

Anyway, does anyone know of any way in MS Outlook Express to intercept someone else's font settings and force YOUR OWN personal settings, regardless?

No offense to this guy, but it's _really_ irritating. I've been trying to be patient and remain quiet about it, and to use e-mail filters, handling it on my own end. But he _thwarts_ e-mail filters and makes them completely useless. I don't appreciate it.

These fonts are _designed_ to be used for _personal_ mail, I thought -- not for use in newsgroups.

Thanks,

Todd

Lose that piece of crap browser "newsreader" and get a real news reader,
and you won't have this problem. Forte Agent, for example, never has a
problem like this.

The is amator radio in these frequencies :
1.240 to 1.300 Ghz
2.300 to 2.450 Ghz
3.300 to 3.500 Ghz
5.650 to 5.925 Ghz
10.000 to 10.500 Ghz
24.050 to 24.250 Ghz
47.000 to 47.200 Ghz
75.500 to 81.000 Ghz
142.000 to 149.000 Ghz
241.000 to 250.000 Ghz

that's all I know

4946. FS: NOS Standard Radio Equipment

Newsgroup: rec.radio.scanner
Date: 1999-09-23 00:00:00 UTC
From: WA9FDZ <starman@mtco.com>
Message-ID: <37EAD7D1.3B4D@mtco.com>
Source record: 106326

Since Standard Radio has supposedly gone out of business, warehouses are opening their doors and releasing some of their excellent radio gear at great prices.

I have 3 pieces of "New-Old-Stock" Standard Radio equipment for sale. These are new and never been sold for use. They are in the original box. I did open each to insure that the battery was ok and would take a charge. These are radios that have been stored in a warehouse for over 5 years. The NiCd batteries charged up fine and full output was noted from each of the two handy transceivers.

Here is what I have to offer:

(2 units) Standard Radio C468A 450 MHz handy tranceivers. Rated at 5W power output. They have paging, DTMF, Tone for repeaters, Memory scan, 40 memories, Soft case, Manual & Schematic. Excellent, compact, well constructed little rig with plenty of bells and whistles. They list for about $480each but, I am asking $125 each plus shipping. Remember, these are New-Old-Stock, not used radios. Truly a fantastic deal.

(1unit) Standard Radio CCR708A VHF & UHF Communication Receiver. Covers 50 to 905 MHz continuous, no gaps. This is a receiver that was manufactured before certain frequencies were banned. The front panel incorporates a large, easy-to-read display with built-in spectrum scope. There are 100 memories for your favorite FM-N, FM-W, or AM frequencies. Extremely high quality and not just another scanner. List for over $800 but, I am asking $450 plus shipping. Remember, this is a New-Old-Stock radio. Great bargain!

Thank You,

Steve Starman WA9FDZ

Mike,

I just bought a Radio Shack PRO-91 and it works great! The sheriff's office is, for the most part, using digital, but everything else is in the clear...

Most of the municipalities here in North County are trunked and on the North Cell. There is a South Cell as well, but not much use up here.

Escondido has their own trunk system which is separate from the San Diego Regional Communications System (RCS), but the frequencies are listed in the ScanFan Book, which is available from HRO (Ham Radio Outlet) in San Diego...

Sounds kind of non-productive. Why not just go to Target in the first place? Of course if confrontation is the name of the game, then by all means hit RS first, and demonstrate your command of the locla language and your self control by loudly announcing your intentions to buy elsewhere, THEN walk out.

My, don't we feel better now? We were able to indimidate someone today!

Like the title of the old TV show: "Different Strokes."

I hear the same goes for interfering with a call, police, fire etc. like responding to see a big fire yourself, checking out accidents, you get the picture. The rubber neckers we are in this state should remind us that common sense should prevail in the use of a mobile scanner here. Off topic, whats the deal with the new license plates here? Are they ''required'' the next time we pay our tax, uhh, I mean registration fee. Will they mail them out like used too? They are so lame aren't they? Many other states are more creative in this department IMO. Vic.

>How are you going to get around the security code feature that is unique to
>each phone? This "marries" each handset and base to prevent base use by
>another handset. This goes way back to the 46Mhz phones.

As I understand it, the "security code" is just a magic cookie that
the phone and handset agree on, and which the handset has to send to
the base before the base is willing to do things like making outgoing
calls. Without the security code, you can't make phone calls using
your neighbor's phone line.

But it's not an encryption code. If all you want to do is *listen*
to your neighbor's phone, you don't need to know the code.

Dave

4958. Re: Pros and cons Icom R-2

Newsgroup: rec.radio.scanner
Date: 1999-09-23 00:00:00 UTC
From: "P. Goddard" <zeiro@mindless.com>
Message-ID: <37E99149.15486E4E@mindless.com>
Source record: 106436

I've had my little R2 for over a year now and overall I'm still happy with it, they're a great scanner and solid like a rock. I am replacing mine (well I might keep the lil guy, I do love it) because I want a few more things such as alpha tagging, more channels and better interference rejection (this is a slight problem in my R2 but it may have been improved with newer models.). Batteries last forever in the R2 but you'll still be forever charging batteries as there's no way of attatching external power. Overall I think you'll find that most people who own an R2 love it and are very happy but I think most of us have a few little dislikes. The ugly plastic belt clip is a sore point for many and so is the confusing way channels are aranged in memory and also banks can't be linked so you can only scan one or all memory banks. One thing which annoys me is there's a little "phut" noise as the amplifier cuts in to broadcast a transmission and when the R2 slips into power saver mode it kinda ticks like a clock, both don't bother me too much unless I wear an earphone.

If you go have a look at the "Radio Survey" section on www.strongsignals.net you'll see that user opinions have ranked the R2 higher than any other portable with the exception of the AOR AR8200 which says we're almost all pretty happy R2 users.

In my opinion the R2 has the right combination of size, features and all round performance to make it an almost unbeatable portable unit, but if you plan a fair amount of use at home you can do better, no external power really hampers home use.

Also if your area is RF intensive you may want to look at something which can handle it better. (I hear Icoms IC-R10 is excellent in this department).

No.

Sounds like your "friendly" neighborhood Radio Shaft clerks are lying
to you in an attempt to get their name and address percentage up.

You have two options:

Non-confrontational option: Give a fake name and address, preferably
the manager's name and store address of another Radio Shaft store.

Confrontational option: Tell them to their faces that hey are liars,
and *insist* that they get their District Manager on the phone
IMMEDIATELY so that he can explain Radio Shaft's policies to them.

:
: TNX,
:
: Eric
:

You have got to be joking.... You want cell freqs you'll
have to import a scanner from another country, Don't expect
a major company like Radio Shack to be selling equipment
that would break direct rules and polices forbidding such
activity. Go and find a good used scanner like a Pro-34
or maybe one of the older first developed 800mhz capable
scaners. Anything that is newer than 5 years old isn't
going to be able to do it after what the FCC did.

I use two approaches, depending on how I feel (either initially or after
they do their best to piss me off). I'll basically say "no". I might
ask them if it's worth it to them for me to walk out. If they don't back
off on the first try I'll usually walk out. Most of the time they give up
after the first try.

Hello,

I am trying to build an amplifier, and I am working on the COR
part of the amp. This amp will be operating at 2 Meters 146 MHz.
I am using the COR section from a 10 meter amp to use in
my amplifier. It says to use a 22 uH RF Choke.
But, that would be at 28 MHz, so what rating would I need
for it to be used at 146 MHz???

I would really appreciate some help here if possible.
I can E-mail you a picture of the schematic, so that you
can see what I am talking about.

If you can help me, please E-mail me.

E-mail: mikrounit@hughes.net

Any help is appreciated.
Thanks & 73,

The identical kit installs in the R7000, same way as in the R71.

>The R-7000 run on AC gets very hot, and also, my AC supply makes a loud
>whining noise while it is warming up.

Both the R7000 and R7100 run far too hot. When racked and stacked with other equipment, most receivers eventually fail. We saw this over and over in large government installations.

The solution is to run the things from an external 12 VDC supply, to remove the heat generating component. You likely will be doing this very soon, as the whining noise is the final symptom hours before the internal supplies croak.

In the much improved R8500, ICOM remoted the AC supply. This keeps the heat as well as the weight down, allows for a smaller package, makes conversion between 110 and 220 volts easier (just change the power supply and leave the radio alone).

Thanks for making clear what I only tried to.
While I get perfect pictures from my PCR1000 and the dedicated receiver

that I just completed, most people are not after perfection.
One of the biggest thrills of my SWL/Scaning/Ham radio lie was the first image that I recieved and it showed a Hurricane. I have that one as my wallpaper on my work PC and a laser print framed on my "shack" wall.

Hey Dr. TOM? Have you heard of decaf? Try unbuttoning that top
button there pal. Maybe you'll take life less seriously.

I don't really care what you think of how I conduct myself. I base my
attitude on that which I recieve from the sales person. I rarely find
that "confrontation is the name of the game" but when it is then
that's the way to play. If they're going to lose a sale because of
their silly insistance on getting my address & phone then they should
know why I'm not buying there.

>DJ-C4 credit card sized UHF tranceiver. I can receive the 20 mw EIRP
>signal two kilometres away.

Yes I did a similar thing with a pair of cheapo walkie talkies years ago. I
didn't have a handheld scanner to take outside with me during my cigarette
breaks (we don't smoke in the house - bad for the little ones) so I rigged
up a voice activated walkie talkie to the earphone connection on the
scanner, so I didn't miss anything when I wasn't in the "radio room".

It also made watching TV out in the living room fun - I didn't have to sit
wondering if I was missing anything good on the scanner. Then I bought a
handheld and dismantled the whole setup.

But I know what you're talking about.

The only beef I have with you Barry, is that you come on here purposely
baiting people and then have the nerve to get all upset and defensive when

they blast you right back. What else did you expect? Did you honestly expect those people whom you so rudely insulted to denounce their faith and beliefs based on one person's narrow minded opinion? I could debate theology with you for the rest of our lives and neither one of us would see eye to eye on it.

Sure. Maybe it is all a myth. Maybe there isn't any such thing as God, and the foolish Christians are just wasting their time and effort pleasing a non-existant being. Maybe they are wrong. That's fine - I can accept that as a possibility. It's possible that the universe itself and everything in it was formed with no divine intervention whatsoever, and no intelligent being is or ever was controlling the course of everything we know and understand. Right?

It's also possible (and just as likely, in my opinion) that I will sprout large white feathered wings and fly south for the winter. But that's MY belief. I have mine. You have yours. We both disagree. Those are 2 things we have in common.

Three, if you count scanners.

My 7000 is neither hot nor noisy. However, I'm now concerned a bit, given the above comments. It appears on the schematic that there's a jumper connector on the "regulator" board which takes the 12v out, then back in. May I assume that that's where the "mod kit" facilitates external DC? Thanks.

For photo of these inanimate objects, see:
http://rampages.onramp.net/~peabody/scancase3.htm

I have a handful, so $10 each or two for $16, includes postage while they last. If you want more than two, letï¿½s talk. Originally manufactured and sold for $19.99 as the perfect fit for the Pro-60. Adapts extremely well to the Pro-43, 39 and 64 models. Leather with belt clip and a perfect rectangular cut out to expose both AC and charging jacks on the side of the 43 and 39. Still in original Tandy wrapper, including silica package to remove moisture. Tandy introduced leather scanner cases in its 1997 catalog, which left the 43 and the 39 out. If you decide to get any, I'm not selling them "as is" or anything, so send it back if it's not what you had in mind and I'll return your money. I'm a reasonable fella. :-) Wrap that rascal!

Thanks for the info, John. I'll check into Hutton and Tessco for the helluvit. However, I'm getting a plate with a 10" pipe with another smaller plate welded up by an associate for $25. I'll mount the bigger plate on the flat tranny hump and have the upper plate for attaching the radio brackets. It won't be as finished looking as a black GamberJohnson, etc., but that's what paint's for. <g> Thanks again.

>May I assume that that's where the "mod kit" facilitates external DC?

Turn the radio upside down and open it up.

Inside you should see a 3 pin Molex connector, white translucent
plastic, with the two outer pin slots occupied. The connector probably
is just flopping loose inside the radio.

One half of that connector is a jumper, usually a red wire. The
internal 12 VDC supply comes into the connector, then goes through the
jumper, then back out, to power the radio from AC.

The external power kit is nothing more than a bracket that lets you
mount this Molex connector through a pre cut hole in the rear panel,
and a 12 VDC power cord with wire leads into a mating Molex connector.
When you run the radio on the internal supply, you leave the jumper
plug connected, at the rear of the radio. When you run on external 12
VDC, you pull that jumper and plug in the DC power cord.

We hung the jumper from a lanyard on the back of the radio so it
didn't get lost.

You don't need the kit. You can do the above yourself, easily. The kit
is just a bit more elegant.

Same kit, same part number, for R71/R72/R7000/R7100 and probably some
others.

Howdy,

I have a good condition PRO-91 with rubber duck antenna.
Radio has a few scratches, but nothing major.
No belt clip, box, or manual, but the manuals should be available from
the Rat shack web site.

Will also include original Spectrum database from Percon (1996 edition)
I do not have any time to devote to scanning, and need $$ for other
interests...

Price is $115 + $5 to ship USPS priority 3-day OR trade for Icom Q-7 HT.

"D Stark" <dave@nf2g.com> writes:

>Precise & Coarse Acquisition 1575.4200 MHz
>Precise Acquisition only 1227.6000 MHz

In case anyone is wondering where those frequencies come from,
they are exactly 154 and 120 times 10.23 MHz.

Why 10.23 MHz? That's the clock rate of the precise (military)
pseudo-random code used in the spread spectrum transmitter.
The coarse (civilian) code operates at 1/10 the chip rate, or
1.023 MHz. And it uses this particular rate because the coarse
code uses a pseudo-random number 10 bits long, which repeats
every 1023 clock cycles (1023 = 2**10 - 1). Which means that
the coarse signal uses a spreading code that repeats at 1 kHz,
exactly, to some extremely high accuracy - so it can be used
for timing.

So 1575.42 MHz is 1000 * 1023 * 10 * 154 - exactly.

In practice, the satellites have a 10.23 MHz clock source, and
all of the timing of the output signal - both carrier frequencies,
both spread-spectrum chip rates, and data carried on the signal,
are all derived by dividing and multiplying that clock frequency.

4998. Who sells/builds mobile hump mounts?

Newsgroup: rec.radio.scanner
Date: 1999-09-24 00:00:00 UTC
From: rfenforcer@aol.com
Message-ID: <19990924003838.09319.00000320@ngol02.aol.com>
Source record: 106248

While we're on the subject, does ANYONE make a mounting bracket for multiple radios that will fit over the transmission hump?

What I am envisioning is a metal "rack-type" mounting apparatus where 3 or 4 radios could be "stacked" vertically and mounted in the area between dash and seats. A strong, sturdy mount that would attatch permanently via sheet metal screws to the car floor above the transmission...completely covering the "hump." Something like this would provide a neat, custom installation for all my equipment.

Come to think of it, what do the cops use to mount their multiple radios? Since I drive an early 90s Mercury Grand Marquis (dimensionally equivalent to a Ford Crown Victoria), I'm thinking whatever works for them would work for me as well.

Who sells and/or custom-builds these things?

Note: this address does not accept unsolicited e-mail. Please contain all discussion regarding USENET posts to the appropriate newsgroup thread.

Greetings Phil (or is that Barbara)..

Indeed, *very* few scanners are ultimately capable of adequately receiving the NOAA APT transmissions at 137 MHz. Reason being is the necessity to have a substantially wide bandwidth at these frequencies. As such, most scanner's bandwidth is too restrictive. The exception to this is some of the semi-professional receivers with IF monitor outputs. However, the ICOM R7000 / R7100 or R8500 are capable receivers *with* the addition of proper filtering on the IF output. In addition you'll want a APT Turnstyle type antenna (ultimately) with preamps at the antenna for additional gain and low noise especially regarding long runs of coax. In addition to the above components, you'll also need a decoder box to decode the audio prior to sending it to the computer and thus the imaging software. Certainly, one of the least expensive ways to decode WEFAX images is over HF (short wave bands) however, you'll also need a small decoder along with WEFAX imaging software to complete the package.

Not as easy as you thought..? Well, don't give up!! It's quite fantastic to actually see a satellite image painting on your own screen as you hear the "braaaap, braaaap" continuously going in the background. It is a rather slow process as it typically takes several minutes to paint an image to the screen. But it is magic to see happen. One thing that really is necessary for good imaging is a location that isn't *so* prone to interference on the 137 MHz band. While out of band filtering is possible, local electrical interference can raise havoc with attempting to receive clear undistorted images.

Reference:
"What does one need to receive GOES satellite pictures and where do you get the gear from" in this news group.. Look for my reply as I list a few URLs that you certainly may want to pursue. IF you can't find it, let me know and I will copy contents over here. However, I would like to keep from cross-posting if at all possible.

Cheers,
Gary

Get the ar8200. The features of this radio and its receiving abilities make it the smart choice. Don't waste your diskspace with the garbage software from aor to run it though. Spring for the arc8200 from butel.com and you will not be disappointed. I bought mine from Javiation in the UK along with the rs 8200 cable. Highly reccomend them for professional service with a smile. Keith

5005. Re: UBC3000XLT problem

Newsgroup: rec.radio.scanner
Date: 1999-09-24 00:00:00 UTC
From: phn@login.dknet.dkx
Message-ID: <7sfbimmbj1@news.dknet.dk>
Source record: 106255

Hi,

barryo@fastlink.com.au (Barry O'Grady) writes:

>My UBC3000XLT has a minor but very annoyng fault. The battery warning
>comes on less than an hour after a full charge. I can ignore the battery
>icon on the display but the beeping is annoying. There is nothing wrong
>with the battery as the radio continues to work for hours after the
>low battery warning comes on.

Most likely one of the 5 cells in the battery pack is faulty.
The BC3000 will run fine on 4.8 volts from 4 cells but the
low batt indicator will be on constantly.

You might try to compeltely discharge the pack followed by
a full charge. Repeat this a couple of times. It this does not
help then run the scanner until the problem appears, disassemble
the battery pack and measure the voltage of each cell. This way
you should be able to identify the bad one. Replace this with a
new one and it should work again.

> I wondered if there might be an adjustment
> for the low battery voltage. At the least I would like the low battery
> beep turned off. Any ideas?

This could also be a very convenient modification if one would like
to run the BC3000 from 4 AA NiCD og NiMh cells.

Regards
Per

>

I suggest there is a third option...leave the batteries there on the counter at Radio Shack where the clerk has to put them back on the shelf himself or herself. Walk out the door, and down to the other end of the plaza to the Wal-Mart, Target, K-Mart, Odd Lots or other store and buy your batteries there. They'll probably cost less there anyway, and they don't care what your name and address is unless you are using a credit card to pay for your purchases.

Howdy,

New content is being added this week. Check out the SWL links, the DX news, or the Propagation Center.

I've moved the QSL and Callbook section off of the main page and onto a page dedicated to just this information. And I've added a lot more to this section.

So, come on by and check out my non-commercial SWLing/Ham Radio website. The URL is http://hfradio.org and features DX information, including QSL Route/Manager Lookups and Callbook Lookups; a Propagation Center including my eAlert service (allows you to sign up with your email address. Then the eAlert system will send you email propagation reports. I use this with my pager.); Equidistant Azimuth Map software (allows you to create maps of any QTH); Swap and Shop; Bookstore (I've hand-picked over a thousand book titles on radio, etc.); Free website space for YOU to create your own Ham or SWL site, and there's more. Easy to navigate. Open for suggestions.

If you feel up to it, after looking around the site, drop me a note (you'll find my address on the site) and share your thoughts.

73!

I've heard this bandwidth comment several times before and I'd just
like to say that I have an unmodified Icom R100 attached to a homebrew
turnstile antenna using a Radio Shack TV preamp and I get quite good
reception using Wide band FM (also used to capture good GOES signals
when they were retransmitted over C-band.) Sure I don't capture the
full bandwidth of the signal, but it really comes down to what you
define as "adequate."

Hello Everyone,

I have the following for sale. All items are in very good condition or better unless otherwise indicated. I would like to sell the indicated packages as packages unless I get a great offer otherwise. Below prices include CONUS UPS shipping. Payment by US Postal Money Order ONLY, and prepaid. NO C.O.D.'s, etc. Serious offers considered. Please e-mail directly to n3fvg@worldlynx.net if interested.

ICOM HF Mobile Package - IC-706 HF/6M/2M mobile with Icom AT-160 automatic antenna tuner, OPC-599 acc cable, Comet CF-530 HF/VHF duplexer and all related standard accessories, manuals and boxes..... $ 950.00

ICOM IC-03AT 220 Mhz. HT package - IC-03AT with BC-35 desktop charger, brand new BP-7S battery, BP-8S battery, IC-DC1 Mobile Adapter, Icom speaker mic, manuals, standard accessories and boxes..... $ 325.00

STANDARD C228A 2M/220 HT with CNB-153 battery pack, rubber ducky antenna and plug in charger ONLY..... $ 300.00

BEARCAT BC-3000XLT handheld scanner, 25mhz.- 1.3 ghz. (less cellular but will receive "images), rubber ducky, ac adapter and charger, battery pack just rebuilt. Includes copy of instruction manual..... $ 225.00

RADIO SHACK PRO-62 handheld scanner, 30mhz.- 960 mhz. (less cellular and 220 Mhz. band), with optional leather carry case, rubber ducky, alkaline batteries, and standard accessories in box. Only programmed, then put back in box, never used..... $ 150.00

MFJ-989C Versa Tuner V HF antenna tuner. No original box or manual but used very little. In excellent condition..... $ 250.00

KENWOOD MC-60A amplified microphone. In box, excellent condition, no manual..... $ 100.00

KENWOOD UT-28S 10M unit for TM-641/741/642/742 mobiles. Brand new in box, never used..... $ 260.00

(1) KENWOOD MC-44 microphones, 8 pin din plug, brand new in boxes, never used (tentatively sold) ..... $ 25.00

DIAMOND MX-214 Duplexer (2M/220)..... $ 45.00

Unknown brand HF SWR/Wattmeter, German mfg.?, says it handles 1KW but I wouldn't try it. Probably handles 300 watts, in box..... $ 25.00

(4) JOBCOM UHF handheld portables, 2 channel, 2W, 1 channel installed,
3 on same frequency, 1 on different frequency. Easily re-crystalled.
With rubber duckies and plug in chargers..... $ 200.00 for set

MAXON VHF-hi , model CP-0510 handheld portable, 4 channel - 1 installed,
with drop in charger..... $ 50.00

TERMS: PREPAID only by US Postal Money Order. Prices include CONUS UPS
ground shipping.

> Which one to believe ?

These are all good programs and with exactly the same kepelerian elements, they should be exactly the same. You must have you location correct, time correct and good elements.

I am using OAR 3000A scanner with regular whip antenna, will that be enough to receive any 137,xx MHZ satellite signals ?

All the other answers are correct about bandwidth and antennas. You CAN received the orbiting satellite as it passes, but the results that you may get from your decoding software will not be very good. The receiver with a wide bandwidth and a good outside turnstile antenna is important. Other types of antennas are good too, but usually more expensive.

> I'm in NYC if that makes any difference.

NOT at all. When the bird(s) passes you will be able to receive it.

> I also have WX-SAT program do decode ? Is that any good. I tryed to
> decode some signals on 4.762 mhz and 6.496 mhz. signal strength was fine
> but nothing would show up on the screen.

I'm not familiar with this software. Receiving the HF wefax can be a little tricky. Sometimes, you have to "tweek" the SSB frequency.

GOES reception requires fixed parabolic or loop antennas for 1.6 to 1.7 gig freqs., a downconverter to 137 Mhz. range and then followed with what a person has for the orbiting birds. Can be quite an investment.

You might find more info at:

www.drig.com
www.dransom.com
www.qcom.com
clestrak.com

Good luck

Has anyone adapted their Icom R-7000 to run on 12 VDC?

I have a kit for my R-71A which allows this, and the setup in the R-7000 seems very similar, but I've not heard of anyone doing it.

The R-7000 run on AC gets very hot, and also, my AC supply makes a loud whining noise while it is warming up.

Anyone?

>"Beware of the massive impossible!"
Not to dispute any of your data or explanation, but if the "spread spectrum" is spread out over a wide enough "bandwidth", then any receiver that has a bandwidth wide enough to cover the "spread spectrum" will recover the audio.
Severla yeas ago some one in my neighborhood bought a spread spectrum that a Pro2004, in the wide FM mode, would intercept.
And more recently I have interecepted even wider spread spectrum with an old surplus (either telco or military..the radi has no markings other than "1 to 2 Gigacycle Receiver") radio that covers from about 840MHz to 2540MHz and has bandwidths up to 24MHZ. The recovered audio is weak, and if there are any other signals in the "passpand" it becomes more difficult to hear the conversation.
Please note: It is not my habbit to listen to anyones telephone conversations. But in the course of looking for more interesting signals I have ran across "noise" that on closer attention revealed themselves to be voice communication. I just wanted to set the record straight that SS by itself does not do a lot to insure privacy. If I could intercept and "decode" the conversations, people should assume that people with a real desire to "evesdrop" can also find ways to intercept supposedly "Secure" cordless telephone conversations. IT is very easy to understand human conversation even with a lot of the "data" missing. I have seen some exoitic analog scambling systems that, to look at either a oscope or time domain display of the result would leave one to believe the voice would be unintelleable. But the good old human ear ignores, filters whatever the result and can understand the connversatin with little if any difficulty.
If you wish to disagree at least take the time to get a wide band reciever and see what you can "hear".

>interference can raise havoc with attempting to receive clear
>undistorted images.

The Icom PCR1000does a breat job on APT reception. And like you said an antenna designed for APT reception will help. I have used a Tandy Pro2004, in the WFM, mode to capture "acceptable" images. Every improvemnt that I made in that system, add a preamp at the radio, move it to the antenna, build a crossed dipole(cut for 137), get the phasing harnes to work(arg!), add a better preamp to the crossed dipole, build and add a QDH andtenna, and fnially, build an out board IF strip, with the proper 40-50KHZ BW, improved the image. But on good passes, those that raise to say 75 degrees, a Pro2004, in the WFM mode, with a Tandy diskcone antenna(fed with good coax!!!) will alow you to view and after that first fairly clear image will moticavte you to keep improving the system. I have seen a friends

setup, where he uses a scanner in the NFM and a peice of software that "adds" back the lost detail and it works much better than I would have thought.

In central Kentucky the most common form of interference is from civil aero comms in the 135MHz range. Not too common in my area, just an irratation when receiving a good pass showing Floyd .
Good listening, or should I say "Good Viewing".

Oh not quite true. Sure, you won't get perfect images, but they
can be quite acceptable to most people. And get them hooked.

There are two issues. One is the bandwidth. And yes, you
probably should use a 30khz or so IF if you want to get the
equivilent of 6-bit resolution. I seem to remember that the
old FAX units that WEFAX is based on had a 'calibrator'
that was essentially 6-bits. But the actual WEFAX signal at
136MHz is analog. With a limited IF, you may be lucky to get
a clean 2 bit resolution (that's 4 levels of grey scale) but that
can be quite impressive, especially just starting out.

The other thing is the doppler shift, which can be extreme.
But a lot of modern scanners can 'almost' handle that.

The bottom line is just because it isn't 'prefect' to the best it
can be does NOT mean it won't be impressive to someone
starting out and wanting to see what it is. THEN they can
buy the special dedicated $100+ receivers and the PLL
decode boards that lock to the WEFAX carrier and do
peak detect on quadrature for a lot of bucks.

By the way, the best antenna for this is where people should
start out. There are simple plans for WEFAX reception in
Taggets book "The Weather Satelite Handbook" that are
very easy to build. A turnstile works best. Beginners sometimes
forget that they want to receive from an 'arc' over their heads,
and a normal scanner antenna would actually do oK on horizon,
but DROP signal strength as it comes overhead.

Bottom line is try it with what you got. See something, then
figure out where you can improve it.

My recollection is it is aroudn 1400Mhz, and the output isn't all that high (tens of watts). The best place to start looking is probably http://www.navcen.uscg.mil/gps/

The US Coast Guard is responsbile for the civilian side of GPS, and no doubt many GPS questios have answeres available either there, or on the GPS BBS that the USCGS operates.

Jun's Electronics in CA has them in stock for $349.95 and about $7 shipping.
1(800) 882-1343

Lentini Communications apparently rec'd a shipment Wednesday, but the reports on all fronts seem to indicate that they're going fast. I believe Lentini's is selling them for $329.95.
1(800) 666-0908 -or-
<http:www.lentinicomm.com>

I'd recommend that you visit Rich Wells' "Strong Signals Resource Page"

<http://www.strongsignals.net/>

for preliminary release info on the VR500, and over the last few days he has added some great "first impressions"-type details from a few sources, and some pretty nice pic's of the receiver from different angles, etc.
Methinks Yaesu has another winner on its hands, as the reviews are consistently quite favourable.
Take note, too, that one of the oft-repeated strong points of this li'l guy is dynamite sensitivity on the AM VHF aircomm's, even with the rubber duck antenna. Mil- and Civ-Air listeners take notice! :-)

Hope this has been of some assistance, have fun!
Mike

5034. Need a hint for TK-940

To Kenwood TK-940 experts.
I built the interface board and still can't get a response from the radiousing kpg-25d software.
Using one of the Maxim chips, cobled together the level shifting function.
RS-232 levels from the serial interface are directed to pin 3 of the mic jack.
TTL levels from pin 6 are sucessfully converter to RS-232 levels back to the serial port. For reference , pin 1 is +V from the mic cable and pin 2 is ground so pin 1 is powering the converter /levelshifter. Both pin 3 and 6 are high when removed from the Maxim chip and when tied together and externally pulled high , I can run a terminal program and sucessfully loop back through the converter. Tried reversing pins 3 and 6 still no response.................any hints?

Well, I have a 7100, and it also runs hot on AC
power, and was noisy, too. I guess they didn't
think it needed changing!

I run mine on 12V (13.8 actually), from a couple
of gel cells being charged by a little CB supply.
Works great! It does draw more than a couple of
amps, though, so you'll need a big enough supply.
This radio came with a 12V cord, that plugs in
place of a jumper on the back of the radio.

No noise, much less heat. Great radio!

:Just a quick question for you Barry. Do you even OWN a scanner? Or are you
:just bored with the other newsgroups you frequent?

I have several scanners and I know how to use them.

:Certainly there must be SOMETHING better for you to do in Australia these
:days, hmmm?

There is, but one of the great things about scanning is that you can listen while you do other things. Also, I found out that it is possible for one person to do more than one thing in their lifetime. I am sure that you don't spend all your time posting off topic messages to the exclusion of any other activity.

To keep this on topic, did you know that you can use an LIPD transmitter to relay the output from your base scanner? If you live in the US you may have similar regulations. I use a DSE 20 mw 434 Mhz walkie talkie to relay the output from my base scanner, and I listen on an Alinco DJ-C4 credit card sized UHF tranceiver. I can receive the 20 mw EIRP signal two kilometres away.

My UBC3000XLT has a minor but very annoyng fault. The battery warning comes on less than an hour after a full charge. I can ignore the battery icon on the display but the beeping is annoying. There is nothing wrong with the battery as the radio continues to work for hours after the low battery warning comes on. I tried to get it fixed under warrenty but at that time it was too intermittent. Now it is worse so that I do not use the radio at all. I wondered if there might be an adjustment for the low battery voltage. At the least I would like the low battery beep turned off. Any ideas?

You should have done that in the first place. The price at Target is much less than what you will pay at Radio Shack. Did you know that nearly all of their Radio Shack brand merchandise carries a markup of at least 50%?

5048. FCC Database changes

Newsgroup: rec.radio.scanner
Date: 1999-09-25 00:00:00 UTC
From: Harry Marnell <marnells@snowcrest.net>
Message-ID: <7sikr0$72p$1@mail.snowcrest.net>
Source record: 106093
Cross-posted to: alt.radio.scanner,rec.radio.scanner,alt.emergency.services.dispatcher

I see that the FCC has shut down their short-form "svartifoss"
Land-Mobile-only search site, and tells you to go to the regular "gullfoss"
site.

Also, new there this month is the following stuff. Quoth:

"NEW! The International Bureau Filing System (IBFS) data, including Earth
Station, is now available with updated context queries. These new queries
were put into place on September 22, 1999.

NEW! Mass Media data, including AM, FM, and TV Broadcast data, is available
as of September 21, 1999. There is no State/County data for Mass Media.

NEW! The MDS/ITFS data is accessible through the General Menu Reports system
as of September 9, 1999.

NOTE: The Microwave data has been migrated into the ULS database. As of
September 1, 1999 this data is accessible in the General Menu Reports
through the ULS DATABSE. The MICROWAVE PENDING data is temporarily
unavailable. This data has not yet been migrated into the ULS database."

Thus saith the FCC.

I am clearing out the ham shack of all my QST magazines once again. If anyone is interested, I am selling
1992-1998 at $1.00 ea. (you pay shipping costs however you want them shipped). If you
are interested in over 12 issues or the entire collection, make me an offer. I am willing to ship anywhere on
this planet so long as you are willing to pay the shipping costs.

Here are the issues that I have remaining:

QST

[1992 through 1998 issues are $1.00 each - 1999 issues are $2.50 each]

1992 Jan Feb Mar April
1993 Jan Feb Apr May June July Aug Sept Oct Nov Dec
1994 Jan Feb Mar Apr May June July Aug Sept Oct Dec
1995 Jan - Dec
1996 Jan - Dec
1997 Jan - Dec
1998 Jan - Dec (May issue is missing page 73)
1999 Jan Feb Mar Apr May June July Sept Oct $2.50 ea.

All the issues are in perfect condition with no ripped pages or covers. Sorry I don't have anymore, but the last
time I did this in 1993, I sold all my 1989 through my 1992 issues less a few months still available.
If you would like to check my references, please feel free to do so. I am on Ebay and my user ID is: Andrew45

Try garage sales. Used scanners and CBs are all over the place. People get
bored with them and practically give them away. I'm making a nice little
profit on the side by purchasing these for $5-10 and selling them on eBay for
$50-75.

:
:>My UBC3000XLT has a minor but very annoyng fault. The battery warning
:>comes on less than an hour after a full charge. I can ignore the battery
:>icon on the display but the beeping is annoying. There is nothing wrong
:>with the battery as the radio continues to work for hours after the
:>low battery warning comes on.
:
:Most likely one of the 5 cells in the battery pack is faulty.
:The BC3000 will run fine on 4.8 volts from 4 cells but the
:low batt indicator will be on constantly.

I thought so too, so I had the battery tested. The shop said the
battery was faulty and I had them replace the cells. The trouble
that the fault is still on.

:You might try to compeltely discharge the pack followed by
:a full charge. Repeat this a couple of times. It this does not
:help then run the scanner until the problem appears, disassemble
:the battery pack and measure the voltage of each cell. This way
:you should be able to identify the bad one. Replace this with a
:new one and it should work again.

It seems unlikely given that the cells are fairly new, but it
could still be worth a try.

:> I wondered if there might be an adjustment
:> for the low battery voltage. At the least I would like the low battery
:> beep turned off. Any ideas?
:
:This could also be a very convenient modification if one would like
:to run the BC3000 from 4 AA NiCD og NiMh cells.

The constant beep beep really gets annoying after a while.

Thanks for your ideas.

Sorry about this to the many that visit the site but the site and my e-mail is still offline as of 16:46pm gmt the
following is from my service provider...

Here is a report on the current status of the disk recovery programme.

By 1800 this evening, we will have recovered all customer data (email
and web space) both onto tape _AND_ onto a temporary file server.

At that point we intend to enable web serving on all customer web
space. It will not be possible to access web space by Ftp.

Once all customer data is safe on tape, the file server will have
the operating system reinstalled and the failed disk array will be
rebuilt to the new filesystem design. Once those tasks are complete
the filesystem will be repopulated from tape.

We estimate that this will be completed by midnight tonight, at
which point a full service will be resumed.

Please bear with us on the time scales given here, as these timings are mainly
dictated by disk<->tape transfer speed.

> Take this simple survey (yes/no) and I will compile the data and post
> here and on my page! I'm not looking for flames..... just your opinion.

Depends on which mode you are talking about Dan.
I operate 2 Meters on a daily basis...100% CW and it
does not sound like CB radio.
But if you are talking about those FM repeaters, yes it does
sound like CB radio! It does in my area and from what I hear
it is the same all over the U.S.
So, you really need to re-phrase your question Dan because
there are many modes you can operate on 2 Meters.
Tnx for the bandwidth.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner

My experience was that it was cheaper to send the R-7000 to ICOM for repair as opposed to buying the service manual and the parts to fix the box! STRONG suggestion - when you do get it working, do NOT use the internal power supply, but run it off a 12-14V external supply. Heat from the P.S. kills all sorts of things, including the display electronics.

The one that is close to me uses 154.600

this frequency is also used by all the schools nearby, as well as several
other places.

Dirk,
That's the most intelligent thing I've seen in the whole thread. Now, for everybody else, can we please get back to radio topics, not the practical aspects of comparative religions. And if you should read something you don't like, ignore it (or ignore the sender, like I've done with you-know-who.au)

All:
I have a Toshiba Satellite 410CDT color notebook computer for trade. For exact specification check out this link:

http://www.csd.toshiba.com/cgi-bin/WebObjects/Toshiba.woa/wa/showSSDetailedSpecs?productTypeId=1&productFamilyId=10&productSeriesId=191

The computer have only been used in a home environment and never mobile. First as my secondary PC then as my wife's email machine. It is in excellent condition both aesthetically and technically. In summary it is a Pentium 90, 40MB RAM and a 810MB hard disk. The unit has a built in CDROM drive, Active matrix screen, 28.8 PCMCIA modem and network card.

I am looking for an AOR 3000A scanner. It must be good both cosmetically and functionally.

Contact Kevin via email mailto:brumey@ns.net

Thanks.....

You know, many airlines leave their ATC radio traffic broadcasting on one of the passenger onboard audio channels. It's great, you don't even have to make the freq changes yourself, and totally legal. Check Channel 9.

Bob,

You've got a great scanner to start with. Lots of mods
available and several interface options. The best place
to go for PRO-2006 information is this website:

http://home.ptd.net/~pro2006/

Lots of links with the information you are looking for there.

Robert

> Thanks Bob

2 full 2-way interfaces exist.
My preference the HB232.
The other is the OS456 (with a later version the OS456 lite)

The Hb232 provides the ability to dump a;; 400 channels into the radio
from your database and to dump all 400 channels data into the
computer. The radio can be disconnected and used mobile or whatever
without loosing the programming.
It also provides a massive ability to operate the radio unatended.

The OS456 is in essence a 'lobotomy or brain transplant' for the
radio.

When connected to the computer it also provides the ability to scan
directly from channels selected from your database.
Also has great ability to operate the radio automaticlly.
It also has the ability to detect and decode CTCSS tones. (the
OS456lite lacks this feature.
It will NOT however dump any channels into the radio memory. When
disconnected, the radio has whatever you programmed in.

There are a couple one-way frequency stuffers whaic will load
frequencies into the radio. Not much use for them meself.

I just skimmed the features of both units, MANY other operating
abilities unwritten.

One feature I love on the HB232 is running a 'script' which allows me
to listen to a repeater input channel and activate the output channel
when a mobile signal is detected. Helps to keep traffic down to a
minimum when the Hywy Dept is plowing snow. I only hear traffic from
trucks which are near me. Don't have to monitor the entire metro area.

I happens to have a couple each of the HB232 abd the OS456 lite.
Installation avalable.

Good Signals... LCM

The Countywide Fire system is still an analog system. It will probably change sometime in the future, but I would suspect not any time soon since they are reprogramming the STX handhelds so they can still be used. The new radios are Astro (digital capability) but the fire system is not currently going to use it.

Nothing on the market currently can scan a digital system, but keep your prayers coming in.

Timothy McGowen

Look for at preowned (used) BC-200.
They probably can be had for your price range if you can find one.
And they can be modified to pick up the full 800Mhz band if it hasn't
allready been done.
Try a local Hamfest.

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
Suggestion: Use a transformer with several 'one to one' ratio windings
to couple the speaker outputs and ensure that the output circuits of
each equipment do not have any DC connection, only audio.
You never know, even if one equipment was switched off that if the
speaker circuits were connected directly together, DC could feed back
from some other equipment and damage the output of the the switched off
equipment.
Also some speaker output circuits might/might not be connected to the
chassis potential of vehicle etc. so direct connection of out put
circuits could be 'potentially' (pun intended!) damaging.
You are only dealing with 'voice' frequencies (300 to 3000 hertz etc.),
so the transformer could be fairly low quality. Even one designed for 60
hertz would prob. be OK to isolate voice frequencies.
Might be easier to use a seperate speaker?
BTW please let us know what you eventually decide is your best
solution.
Regards.

Hi, I use the DOS software from ICOM. It is no frills, strait-forward, but does
all the basic things you want to do just to get the thing programmed. I sure
wish there was a program for Win-98. Anybody know of one?
Thanks

Not for AOR AR5000/8000/8200 owners.
Visit our webiste at http://www.butel.nl

We develop remote software together with users and only for one specific radio, not multi radio software like all others.

Your remarks about the interface is one of the reason why we started developing software ourselves over here in The Netherlands with a group of scanning radio users.

With the exception of two talkgroups (PIO and ARSON) ALL others will be analog. Those two talkgroups will also be encrypted, which I guess is a mute point.

I don't know for sure if it is a type I system, but my guess would be that it will be type II. Can anyone help out here?

OCFA is the first FD to switch over. All will be with the same specs.

The other county agencies including LAW will be changing over soon, Now if they will all be digital I don't know.

Now are you really confused? I am and I work there!

5113. BC 245 XLT or Pro 64?

Newsgroup: rec.radio.scanner
Date: 1999-09-26 00:00:00 UTC
From: Gary Owens <glowens@nemonet.com>
Message-ID: <DyjH3.32013$I6.752880@typ12.nn.bcandid.com>
Source record: 106136

I have owned a Pro 64 for a couple of years now and like it other than it's weight. It seems to be a good scanner. I recently started reading the scanner ng's and as a result decided to buy the BC 245XLT. With the same frenquencies and antannae and the ATT off on the BC, it seems the Pro 64 has alot more activity than the BC 245XLT. I live in a rural area. The closest police station is 9 miles and 20 miles for the larger town. I am receiving from these stations up to appox. 75 miles away in hilly terrain with a RS scanner antanae that's probably at least 15 or 20 years old and very rusty. I have the antanae about 12 ft. off the ground and about 3 or 4 feet below the roof peak. It is at least 10 to 15 feet below tree level w/ 50 ft. of rg58 hooking it to my scanner(s). I thought the Bearcat would receive at least as good as the Pro 64 since I don't see much talk of the 64 on the ng's but have found it does not. I really like the 245 for it's features but am disappointed in it's receiving abilities. Can someone maybe shed some light on this? Is the 245 maybe better in large cities? So if I'm travelling through one I would want to take it instead of the 64?

Thanks
Gary

I'm curious which airplane instrumentation is so sensitive as to render a transister radio as dangerous as a weapon, and likely to turn the plane into a big ball of flames? And if such gadgetry is so dangerous, why are its owners permitted to carry it on to the planes in the first place?

Certanly GPS's aren't going to be affected by a little pocket radio.
Nor will Loran type systems (though the plane's flourescent lights
might interrupt that kind of system). The plane's communication
system shouldn't be affected by someone's pocket AM/FM radio.
Notebook computers MUST emmit more RF noise than a transister radio,
right?

Cheap knock off's? Galls sells the several different models of mounting equipment that would accomplish what the original poster is looking for, prices ranging from an inexpensive $40.00 to over $150.00. I have purchased a good bit of stuff from Galls and I have been pleased with everything I got, so I would be hard pressed to believe they were selling "cheap knock-offs" of another product. Galls is probably less expensive and why they are often more attractive to the the various agencies that they sell to. But it sounds like your the expert here.....

Hi, Bucky,

If you haven't already done so, I recommend that you book mark Rich Wells Strong Signals Resource Page at http://www.strongsignals.net/

From the FAF (Frequently asked frequencies) file at
http://www.strongsignals.net/htm/oak_faf.htm

```
------------------------------------------------------------------------
Television [73.603]
Ch Range Video Audio
2 54 - 60 55.250 59.750
3 60 - 66 61.250 65.750
4 66 - 72 67.250 71.750
5 76 - 82 77.250 81.750
6 82 - 88 83.250 87.750
7 174 - 180 175.250 179.750
8 180 - 186 181.250 185.750
9 186 - 192 187.250 191.750
10 192 - 198 193.250 197.750
11 198 - 204 199.250 203.750
12 204 - 210 205.250 209.750
13 210 - 216 211.250 215.750
14 470 - 476 471.250 475.750 }
15 476 - 482 477.250 481.750 } Range for Ch. N
.. ... - ... ....... ....... } Low = 386 + 6*N
68 794 - 800 795.250 799.750 } High = 392 + 6*N
69 800 - 806 801.250 805.750 }

Note the gaps between chs 4/5, 6/7, and 13/14.
Freqs in the 470-512 MHz range (Ch 14-20) may be assigned to
Public Service mobile use in major metro areas. No transmitters
are allowed on 608-614 MHz (Ch 37).
Each TV channel is 6 MHz wide. The video carrier is 1.25 MHz
above the start of the range. The audio carrier is 0.25 MHz below
the end of the range. Television audio is wideband FM.
Some TV stations may be offset +/- 10 kHz.
------------------------------------------------------------------------
```

Good listening!

Phil:

I know the truth hurts, but as a Commercial Pilot I know what goes on at FL240 and above. Any no mind can listen to planes up there and figure out what is going on. Try listening to Arrival or Departure Control and figure out what is happening and follow them through the various freq. changes. That is when the problems occur and then it gets interesting not in level flight.
Oh by the way there have been several URL's over the years with this one the first http://www.thetrip.com/ft/home/1,2096,1-1,00.shtml oh I hope this is on topic and I suspect you consider Marks comments on listening to snowplows on topic? See most Americans think of Canada as Snow and Ice and most have no idea what is here. Nothing is funnier than watching people arrive up here in the summer with Ski's (snow) and their winter clothes looking for winter fun and it is 30C+ (oh sorry you don't understand that, it is 80F+) It is comments such as Marks that shows his ignorance.

Steve.

Go to

www.fordyce.org/scanning/

Click on "General Frequencies" and follow the link to "Television".

Has the 6 mHz wide channel freqs and the center audio freqs.

Hope this helps.

I apologize ahead of time for the x-post, but I'm not sure where the appropriate place to ask this question is, or if there even is one at all.

On what frequencies do truck CBs broadcast? And how do I pick them up? (Ie, shortwave or scanner?)

thanks for your time,
Donnie

Yes, there's lots more but in order for you to find it, you have to know how to use a Web browser. Here's how it works, whenever a word, phrase or other object is highlighted and/or underlined, that's a clue it's a link. Like the AR8600 on the Javiation site. Click on that, and get a clue. Duh.

Rich,

What base-mobile radio do you consider "best"? I am gettin old and would like a single unit that will buy me the most time (usable life span) before obsolesence sets in. Everyone in my area is going digital so I cannot even monitor anymore, my old BC200XLT has quit so I cannot get cell anymore either..... my hobby is disappearing quicker than my $$$$$ Any ideas MUCH appreciated! I go to your site often, but am lost in all the tech stuff and never even saw my 2050 mentioned? Help! Mike

> Sorry Tom but big business is big business. Let them feel the wrath.
> They do not care one bit about the public any ways.

I understand what you're saying, but if they hit "big business," it's the end user who has to pay... Just as in the mad rush to raise taxes on the "rich" corporations as well as tobacco companies... All these companies have to answer to stock holders, so how do they pay these high taxes and fines and maintain their bottom line???

I'll give you one guess, and if you guess that they agree to keep less profit, you'll be wrong... It will be us, the end users or consumers, if you will, who end up paying for all these increases...

To a politician, one million people paying a dollar each is easier to swallow than one company paying one million dollars... And we still get it in the shorts...

Where do we draw the line???

I think it was Ben Franklin who said: "He who gives up a little freedom to gain a little security deserves neither."

That's a paraphrase, and I doubt it was old Ben, I just can't remember
right now... :>))

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hello everyone,
I've got a BC 200 XLT and the reception in the 800 band is terrible (LA city fire & orange county fire). I have a PRO 26 that had a similar problem. I brought it in to radio shack and they "adjusted the alignment" and there was a tremendous improvement in the 800 reception. Does anyone have any suggestions to improve my 800 reception or know where I can take a Uniden rig to get looked at?

Thanks

I have reduced the price of the 200 XLT (no gaps). It is in very good condition, I am the original owner, with the box, antenna, manual and case, 200 channels, easy to program.

$150.00, I pay shipping (in the US). COD only, cashier's check or money order, please.

Please post any replies directly to me: dabiggs@earthlink.net.

Thanks,
Len Gibbs

Mr. CW:

What kind of opperating do you do on 2mtrs with CW?
Local? DX?. I never hear too much in that part of the band around here. I have heard aroura (did I spell that right?). Sometimes I hear some local ssb, but not too often. I am in south east Wisconsin. I think CW on 2mtrs would be interesting.

>Let's say I do this for the five police frequencies on channels 1-5.
>How do I assign the five channels to one band and how do I make it
>move among those channels?
Band :"1"will be channels 1-20, band "2"will be channels 21-40...
Hold down the L/O key for a Lock Out or skip of this channel. Your
only options for letting the radio hit on any channel or band on based
on weather or not you have
it L/O or not.
To know if the band (1-10) is locked out or not, look at the top of
the display and see the tiny row of numbers, they are activated
by toggle at the K/L key... Hold for a couple of seconds until you
hear a 'beep', Press the corresponding key to turn that band on/off.
I hope this helps, I am typing this from memory as I got rid of this
radio some time ago.(regretfully).

5152. FS or Trade: Alinco DJ-X10 Wide Band Scanning Receiver

Newsgroup: rec.radio.scanner
Date: 1999-09-27 00:00:00 UTC
From: kb5fas@postoffice.swbell.net
Message-ID: <37EF7592.276C8D2C@postoffice.swbell.net>
Source record: 106159

I purchased this receiver <6 months ago and have found after listening to radios in my ear for 12 hours a day (I'm a police/Fire/911 Dispatcher in Arkansas), the LAST thing I wanted to do when I got home was to listen to more radio's in my ear. The result is this receiver has set in the box for most of the time I have had it which is not fair to me or the radio. When it came out on the market, I truly leaped before I looked after hearing everything the radio could do.....

0.1 - 2000 mhz in ALL modes (AM/NFM/WFM/LSB/USB/CW) (cellular blocked)

1,200 memories organized in 30 banks (40 channels per bank)

Alphanumeric on-screen labeling available (Really like this feature - being able to list the name of what is on the particular frequency - not just the frequency number)

"Channel Scope" spectrum on-screen analyzer lets you visually monitor 40 channels at a glance.

2 VFO's

Large, illuminated, graphic LCD screen

Windows based programming/editing software and optional PC control interface (I don't have either of these)

User Friendly operation with selectable user level, HELP message instructs you what to do.

Hand-Held - 57 mm (H) x 150 mm (W) x 27.5 (D)

I have the receiver, battery pack, drop in charger, manual, original box and three antennas. I paid $389 but will take $289 which includes shipping lower 48 states OR would be interested in trading for a good multi band HF rig that I could take mobile or portable or a good 6 meter SSB rig that I could also take mobile or portable.

Sorry for the long post but I did want to fully explain all the features of this receiver.

73's

I like mine quite a bit. The only down side is that the audio output is a bit low when using the on-board speaker. It's okay when using headphones.

In article <37E967CF.A95058FD@ix.netcom.com>, Brent & Sue Hedrick <brentsue@ix.netcom.com> wrote:

5155. Thunderbirds Freqs. 9/24/99

Newsgroup: rec.radio.scanner
Date: 1999-09-27 00:00:00 UTC
From: Greg Brooks <gbrooks@waltonemc.com>
Message-ID: <7sntd9$ht6$1@nntp6.atl.mindspring.net>
Source record: 106162

I went to Montgomery over the weekend to see the T-Birds at Maxwell AFB. When the performance began, there were only five planes. There are always four planes that fly in formation and two solo planes that take turns doing maneuvers. One of the solos was missing.

As they were taxiing out, just as the PA announcer explained that solo number six was ill and would not fly, I discovered the REAL reason from my trusty BC-3000. A couple of the T-Bird pilots were singing cute little songs about number six's apparent upset stomach. I won't go into details here in public, but it was rather graphic and funny. Everyone around wondered why me and my brother were laughing so hard about someone who was *sick!*

There are lists all over the internet for Thunderbird's frequencies. Here are the ones in use September 24 at Maxwell:

Thunderbirds
141.85 AM air to air
235.25 AM operations
322.95 AM air to air
413.025 FM support crews

Maxwell AFB
118.15 AM tower and show control
253.5 AM tower and show control
173.410 FM base police

If you're on an AFB, scan around 170 to 175 to find police and logistics. It was helpful when we were leaving the show and trying to navigate through traffic backups.

Greg

I remember the same problem being talked about with the 200 XLT. I also remember seeing a fix for it. Maybe you could look in some of the radio mod files on the Internet and find it there.

Greg

The last line describes you Mark!

Once upon a time in the Kingdom of Heaven, God went missing for six days.

Eventually, Michael the archangel found him, resting on the seventh day.

He inquired of God, "Where have you been?" God sighed a deep sigh of satisfaction and proudly pointed downwards through the clouds, "Look Michael, look what I've made." Archangel Michael looked puzzled and said,
"What is it?" "It's a planet," replied God, "and I've put LIFE on it. I'm
going to call it Earth and it's going to be a great place of balance."
"Balance?" inquired Michael, still confused. God explained, pointing to

different parts of Earth, "For example, Northern Europe will be a place of
great opportunity and wealth while Southern Europe is going to be poor; the
Middle East over there will be a hot spot. Over there I've placed a continent of white people and over there is a continent of black people,"

God continued, pointing to different countries. "This one will be extremely
hot and arid while this one will be very cold and covered in ice."

The Archangel, impressed by Gods work, then pointed to a large land mass in
the top corner and asked, "What's that one?"
"Ah," said God. "That's Canada, the most glorious place on Earth.There's
beautiful mountains,lakes, rivers, streams and an exquisite coast-line. The
people from Canada are going to be modest, intelligent and humorous and they're going to be found travelling the world. They'll be extremely sociable, hard-working and high-achieving, and they will be known throughout
the world as diplomats and carriers of peace. I'm also going to give them
super-human, undefeatable ice hockey players who will be admired and feared
by all who come across them."

Michael gasped in wonder and admiration but then proclaimed.
"What about balance, God? You said there will be BALANCE!"

God replied wisely. "Wait until you see the loud-mouth bastards I'm
putting
next to them."

This is a legitimate site. It has a lot of real good info on it. If
you look at the entire note you'll see that the call letters are for a
"Rgestered Scanner". Not a ham or other radio operator. Lot of
mititary info at this site seeing that the operator is near NFAF base.

mystar said....
> which scanner has the best-sounding audio on WFM??
>
> when i say "best" i mean that it has nice clarity, does not sound
> compressed/narrow, etc...

A few months ago I spent a few hours comparing an AR8000, an AR8200 and an MVT7100 in a number of different ways including how well they performed on Band II WFM.

WFM was not a priority for me so I didn't keep many notes on that part of my testing but I did note that the MVT7100 and AR8200 seemed to be too wide on WFM and often had nearby (in frequency) channels sort of mixed in a little whereas the AR8000 was much clearer.

All of my tests used a SuperScan II active aerial a few feet above the roof so the signals were very strong. I didn't compare them on their own whips.

In case it's of any interest, I found the AR8000 to out-perform the other two on 2m FM, 70cm FM and civil airband. The MVT7100 was ahead on HF SSB such as Shannon Volmet on 5.505 USB.

Cheers,

Mark.

>receiver that has a bandwidth wide enough to cover the "spread spectrum"
>will recover the audio.

I don't disagree at all. What you describe is certainly possible
--assuming the phone uses a sort of analog FM to begin with and
assuming you're close enough to hear the noise in the first place. If
the spread spectrum signal uses any sort of link power control,
however, you may have a hard time finding this signal.

In any case I've noticed that most SS phones use a form of digital
spreading and digital modulation. Wideband FM won't give you a useful
signal in that case.

If you're curious to see the actual modulation, however, try looking
for the phone just below 1900 MHz (the second harmonic of 920 MHz).
You might find the signal has been spread with BPSK. If you multiply
a BPSK signal by two (pick up the second harmonic), the spreading
cancels itself out. You'll be left with the modulation itself.

Good luck!

nteresting observation, considering Mark is the only one in this thread who has kept it on topic.

Maybe next time one of your loved ones is on a flight and the news reports a plane down, and you don't know if it's THE plane carrying your loved one or not, you'll remember the URL to the site he gave, check it, and breathe a sigh of relief as you see the flight they are on is still safely in the air.

When that happens, try telling him thanks instead of fostering your Canadian superiority complex.

Mark, thanks for the URL. SOME of us know what to do with it. Let the OTHERS steep in ignorance.

Well, no new bill is needed in some states as most already have a
vehicle code law which prohibts covering your ear with a headphone or
headset while operating a vehicle which can be applied to a cell
phone.

So any word on what features the Uniden "Bearcat" branded version of
the base version of the 245 will have? I notice from looking at the
Radio Shack catalog that the 2052 doesn't have a tuning dial or
alpha-tags. I'm hoping hoping hoping that the "Bearcat" version
will... Any thoughts or comments?

Sorry, but all I could find (so far) on your web site is:

AR8600
Watch this space !

Is there something more than this available on your web site?

Thanks in advance,

To anyone interested or knowledgeable,

I am looking at the 895XLT as a scanner. I like the CTCSS built in board and the trunk capablility. However, I don't like the size. I am looking for a scanner that can be mounted in a vehicle without looking like a dash mounted lunchbox. I know RadioShack has a smaller version of it, but does it have the CTCSS? Please reply via email if you have any info or advice.

And if they do this, how long before the not-so-intelligent liberals
who know what's good for us regardless of what makes sense
decide that operating any radio in the car is dangerous.

Just remember, these laws specifically exempt cell phone use
with hands free kits. And the problem, in my mind, is not so much
the people talking on the phones as the people trying to dial,
look up numbers, call forward, call answer, whatever. In fact,
almost everything EXCEPT the actuall talking.

Where is the import function hiding? I can't find it. The File menu
has only Load/Save/Delete/Dos/Exit entries.

I'm using Icom's CS-R2 Rev. 1.0.

I would *love* to be able to import frequencies from a text file
(they're already in a spreadsheet) instead of laboriously entering
them by hand.

Dave

5191. Re: Discriminator tap for R 7000

> 7000? Thanks for any help offered. Bill

I have yet to try this so you are on your own if you do it. I received this in the mail when I made the same request.

Discriminator Output From the Icom R-7000 9/9/97

This output is available from R97 on the main IF board. Locate it as follows:

1. With the radio the right way up, the top removed and the front of the radio towards you locate IC6 one inch from the left edge of the main IF board
(closest to you).
2. Half an inch towards you, slightly to the right of IC6 is R97 (10K 1/8th watt)
3. The left side of the resistor is the discriminator output.

However, it is safest to buffer this the signal before bringing it to the outside world. Here is an easy way to do it using "vertical integration" techniques with an op-amp to buffer the signal. It just requires two solder joints to the board and no cuts.

1. Obtain an LM-358 or equivalent dual op-amp (DIP kind).
2. Cut off pin 7.
3. Very carefully bend pins 1,2,3, 5 and 6 so they point directly up. Try to
make the bends just slightly away from the IC body to prevent the pins from breaking off.
4. Bend pins 1 and 2 together and solder them to each other.
5. Bend pins 5 and 6 together and solder them to each other.
6. CAREFULLY locate the LM-358 directly above IC-6, with the same orientation as IC-6 (notches at the same end).
7. CAREFULLY solder pin 4 (ground) on the LM-358 to pin 4 on IC-6
8. CAREFULLY solder pin 8 (+Ve) on the LM-358 to pin 8 on IC-6
9. The LM-358 should now be mounted by pins 4 and 8 above IC-6, with all the
other remaining pins pointing directly up.
10. CAREFULLY solder a 200K 1/8th or 1/4 watt resistor from the end of R97 closest to IC-6 to the LM-358 pin 3
11. CAREFULLY solder the positive end of a 10uF 25V capacitor to the junction of pins 1 and 2 of the LM-358.
12. Run a thin wire from the other side of the capacitor to the center of the spare RCA connector on the back of the radio. Here is the buffered

discriminator output.

OOPS! I've got "IC-R2 Cloning Software" version 2.00 from RT systems. It was what was shipped when I ordered the radio from Valco. If your software is also from RT Systems, try their support number (256) 880-3093. Valco said they get the software from Icom.

From: headshope@aol.com
Message-ID: <19990928171157.16456.00001941@ng-fu1.aol.com>
Source record: 106005

Question: BTX-121 2 Channel Radio

Calling anyone familiar with this radio...

Anyone aware of any modifications available for the BTX-121 from Radio Shack.

This is a 2 channel, crystal controlled radio in the business band and preset to 154.600 MHz for channel 1 and channel 2 crystal slot clear.

What I am seeking is any tinkering experience anyone may have whatsoever in playing with the radio.

Any modifications that would enable tx/rx outside preset frequency ranges with conforming crystal installed, internal squelch controls, band modifications, power mods, dtmf or the like are sought.

Any adjustments available for this radio?

Understanding the general nature of this request, I am just seeking any mod or adjustments anyone may have experience with this rig.

These radios are on clearance for around $49.00, quite a mark down from the original prices, looks as though they are moving up. This may be a good opportunity to pick up a few.

Thanks for any reply,

Bill.

Do a web search. There are 5-6 sites with freqs, and even a few specialising on Massachusetts.

Scanners to consider? You want base or portable? Go to Uniden and Tandy/radio web sites.

agreed. he's also completely wrong about how microwaves heat food but whatever.

the only known effect of RF radiation on animals is thermal. there is not a single study that can prove RF radiation produces cancer in anything, short or long term (if you can find one, send it over). the only way RF radiation can kill an animal is by cooking it.

fyi, the eyes and gonads are the first to go when exposed to RF, they are the most heat sensitive.

Can anyone help Me? My Pro-2004 Scanner is in need of repair, but the parts have no numbers or vaules on them! I know how to fix it but I can't replace the parts without some sort of technical schematic or diagram. If anyone has a Pro-2004 Service Manual I could sure use some assistance! I tried to order one from the local Radio Shack store but the salesperson couldn't find a listing for the Service Manual (all they to me was SORRY). Please Help Me!!!!

To each his own. He likes it. That's all that matters. What do you like to listen to? There maybe countless thousands out there who can't think of any reasons to listen to what you like. Maybe there's more on the ARTCC high-altitude sector frequencies than you'll ever know.

That's my unsolicited 2 cents.

Hear, hear.. Actually there's much to be heard on the ARTCC high altitude freqs. I've heard in-flight emergencies being declared, sick and/or injured passengers & crew, extreme turbulence related comms, pilot to pilot chit-chat, jokes, mechanical problems, in-flight diagnosis between techs and mechanics on the ground and the flight crew, all sorts of stuff. It isn't constant
or very frequent, but it's definitely worth checking out now and then.

>Does anyone know where to obtain the discriminator output from an R
>7000?

Here is how to pull discriminator audio out of your R7000 to use with various decoders that want clean audio. Use a short piece of shielded cable to the spare jack on the back of your R7000:

Best is junction of C131, C84 and R99 on I.F. board. Take output through a .01-.05 to block DC present at this point.

Not quite as high an impedance, but easier to get to from the top of the board, is junction of R97, R99, C87, C115, etc. This is the other side of R99 as preferred method. Again need to go through a cap.

If you have the service manual or schematic, these points geographically are between Q13 and X3, 1/2 way down and 2 inches in from the right of the schematic.

Be careful not to load the discriminator output too heavily, as it is a high impedance point.

Hope this helps.

On the contrary - I've found most flight attendants are pretty protective
of the flight crew and are usually only to happy to volunteer that their
airline regulations prohibit whatever you ask. I've had excellent luck in
the past just popping my head into the cockpit before takeoff, though,
introducing myself, and asking the captain directly whether there'd be any
problem listening in on my radio. I'd steer clear of the cabin crew.

Blue Skies,
-Pat Dirks.

This is similar to what I did with my discone, except I used a chromed
exhaust hanger mounter horizontally and then mounted a couple antenna's on
it, one for c.b, on for 800, on 440, it made somewhat of a difference.

The Pro-2066 is a 150 channel trunk tracker with no CTCSS. Think of it as a dash mount version of the Pro-91 scanner. I too wish there was a smaller version of the BC895 that I could mount in the car. I like the size of the 895 as it sits on my desk but it's a little cumbersome for use in the car. Are you specifically looking to hard mount the radio or will a vehicle mount for your handheld do the trick for you?

Yes, "alpha tagging" is the ability to assign a name to the
frequencies and group ID's in your scanner. You're right, it's a lot
more fun than hitting "manual" and picking up the trusty scanner list
printout. I cannot believe that this is not standard equipment
nowadays. Radio Shack should have beat Uniden to the punch and
introduced a desktop clone of the Pro-92 right up front. Oh well the
cat and mouse game continues.

5234. Pro-92 Multi-Track Delay

Newsgroup: rec.radio.scanner
Date: 1999-09-28 00:00:00 UTC
From: chuck@nospam.la-radio.com
Message-ID: <37f3255a.2233932@news.uia.net>
Source record: 106070
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Does anyone know if GRE had time to "feel our pain" about the 4 second delay while switching from one system to the next with the BC245 in Multi-Track mode? I hope that one cycle through each system will move you on to the next.

My dreams of monitoring (conventional) CHP and the trunked fire dispatches together were dashed when I learned that I got very little CHP coverage and lots of dead air while scanning through the idle trunks.

Most scanners don't pick these freq's up but here they are. I would
like to listen if I could too. Not sure why these aren't available on
many scanners.

Ch. - Freq.
1 - 26.965 2 - 26.975 3 - 26.985
4 - 27.005 5 - 27.015 6 - 27.025
7 - 27.035 8 - 27.055 9 - 27.065
10 - 27.075 11 - 27.085 12 - 27.105
13 - 27.115 14 - 27.125 15 - 27.135
16 - 27.155 17 - 27.165 18 - 27.175
19 - 27.185 20 - 27.205 21 - 27.215
22 - 27.225 23 - 27.255 24 - 27.235
25 - 27.245 26 - 27.265 27 - 27.275
28 - 27.285 29 - 27.295 30 - 27.305
31 - 27.315 32 - 27.325 33 - 27.335
34 - 27.345 35 - 27.355 36 - 27.365
37 - 27.375 38 - 27.385 39 - 27.395
40 - 27.405

Television [73.603]

Ch Range Video Audio

2 54 - 60 55.250 59.750
3 60 - 66 61.250 65.750
4 66 - 72 67.250 71.750
5 76 - 82 77.250 81.750
6 82 - 88 83.250 87.750
7 174 - 180 175.250 179.750
8 180 - 186 181.250 185.750
9 186 - 192 187.250 191.750
10 192 - 198 193.250 197.750
11 198 - 204 199.250 203.750
12 204 - 210 205.250 209.750
13 210 - 216 211.250 215.750
14 470 - 476 471.250 475.750 }
15 476 - 482 477.250 481.750 } Range for Ch. N
.. ... - ... . } Low = 386 + 6*N
68 794 - 800 795.250 799.750 } High = 392 + 6*N
69 800 - 806 801.250 805.750 }

Note the gaps between chs 4/5, 6/7, and 13/14.
Freqs in the 470-512 MHz range (Ch 14-20) may be assigned to
Public Service mobile use in major metro areas. No transmitters
are allowed on 608-614 MHz (Ch 37).
Each TV channel is 6 MHz wide. The video carrier is 1.25 MHz
above the start of the range. The audio carrier is 0.25 MHz below
the end of the range. Television audio is wideband FM.
Some TV stations may be offset +/- 10 kHz.

5237. New FCC Bandplan VHF / UHF

Newsgroup: rec.radio.scanner
Date: 1999-09-28 00:00:00 UTC
From: ironword@aol.com
Message-ID: <19990928000213.24839.00002607@ng-ft1.aol.com>
Source record: 106073

Does anyone have any information on the new FCC bandplan for VHF / UHF frequencies, and how this may affect the tuning, reception, and performance of current "old bandplan" scanners? I'm not quite sure, but it seems that a change in tuning steps has been made.

Many thanks.

Message-ID: <19990928003235.08458.00000946@ngol05.aol.com>
Source record: 106076

There's one being marketed on eBay right now.

"Full featured Uniden scanner covers WFM/NFM & AM Frequencies in the 25-1300Mhz range with NO BLOCKS.(Came from Canada)"

Fact or fiction? I thought Uniden and Radio Shack only made one version of their scanners (censored) for both sides of the border (?)

Note: this address does not accept unsolicited e-mail. Please contain all discussion regarding USENET posts to the appropriate newsgroup thread.

>I tried to sell my cellular capable scanner and the commie bastards
>canceled the auction!

Funny how they blow a gasket over a cellular-capable scanner, yet the CB section is full of illegal linears and modified radios (marketed as CB linears and CBs with "extra channels"), yet eBay has no problem with this. I wonder why this is?

Note: this address does not accept unsolicited e-mail. Please contain all discussion regarding USENET posts to the appropriate newsgroup thread.

5242. Need some suggestions on buying a antenna for my scanner.

I have a Bearcat 178 XLT at my house an would appreciate any suggestions on a cheap antenna to mount on my roof ($20-$40) preferably from Radio Shack.

I already have a 18 foot mast mounted to my roof and coaxial cable ready to go, just need a decent cheap antenna.

I like to listen to 29 megs.- 480 megs.

Any suggestions ?

Ihave Taht Progran and works for me great, in order works
must be

1- MDT which used by your local services Motorola4800, this
program will not work with RD-Lap mode

2-wil not work out of the External speaker jack, you nedd
data
splitter out put from your scanner.

Be careful on what you wish for too. If cell phones to the ear are banned, what will happen to the price of hand-free car kits? The law will probably make them mandatory for any cell use in a car.

Give 'em a break.
The list of 'banned devices' is in most inflight mags. They didn't write it,
they don't have the authority to countermand it and they sure not going to
bother the captain with such a piddling request.
If you can get his approval beforehand well and good, but leave the cabin
crew out of it.

Brian

5258. CHP/Extenders

Newsgroup: rec.radio.scanner
Date: 1999-09-29 00:00:00 UTC
From: chuck@nospam.la-radio.com
Message-ID: <37f77feb.90968598@news.uia.net>
Source record: 105844

I have two questions concerning the CHP that I hope some of you can help with...

1.) Can someone verify the proper frequencies for the "red" channel? I show 42.44B and 42.28M. This seems to conflict with the "Pink" which also has a base output of 42.44 MHz.

2.) Can somebody explain to me how the CHP extender system works?

Thanks!

there are more indicators which contradict what you say than reinforce it. i agree with erring on the side of caution but not looking at the facts is bullheaded and ignorant. use an external antenna on your cellphone if this is such a huge issue for you.

E-gads...I wonder why so many cops
in so many agencies use them? I guess
they don't like them either, except for the
fact that when they talk, no one is able to
listen.

Lately I hear "call me on your Nextal"
from the SGT to the LT. That is when
i want to know what's going on
to go cover it. It's a news event
i cannot cover.

These cops have the nerve to say on pubic
radios " "go talk to me on your Nextel"....

Mike & Trish wrote:
> What base-mobile radio do you consider "best"?

Hi Mike,
"best" is highly subjective, you know? I could name
a radio but some would call it the "best" while others
call it the "worst." To each their own.
The radio these days that is the most flexible and
able to handle a great quantity of tasks is probably
the Optoelectronics OptoCom. Unfortunately, it is not
your "average" scanner for those that are used to
conventional technology of dials and a keypad.
Expect some new radios from Uniden, most likely
next Spring, that will be models based on their popular
multi-trunking BC245XLT. These will probably be very
"well rounded" and include alpha-tagging and if they're
smart, computer interface as well.
Best of luck in your decision...it's never an easy
one!

I saw where the FCC released the Final Rule of the Communications
Assistance for Law
Enforcement Act (CALEA) on Sept. 23rd, 1999. Check out this link for
details...

http://frwebgate.access.gpo.gov/cgi-bin/getdoc.cgi?dbname=1999_register&docid=99-24853-fil
ed

(1) Need for and Purpose of this Action

14. This Report and Order responds to the legislative mandate
contained in the Communications Assistance for Law Enforcement Act,
Public Law 103-414, 108 Stat. 4279 (1994). The Commission, in
compliance with 47 U.S.C. 229, promulgated rules in this Report and
Order to ensure the prompt implementation of section 105 of CALEA. In
enacting CALEA, Congress sought to ``make clear a telecommunications
carrier's duty to cooperate in the interception of communications for
law enforcement purposes. . .'' ⁶ Specifically, Congress
sought to balance three key policies with CALEA: ``(1) to preserve a
narrowly focused capability for law enforcement agencies to carry out
properly authorized intercepts; (2) to protect privacy in the face of
increasingly powerful and personally revealing technologies; and (3) to
avoid impeding the development of new communications services and
technologies.'' ⁷

Weeeellllll..... to a point. I've found it a bit quirky but
operational. Now to be fair, I'm not using commas for the
separator.... many web sites use spaces. It works, but the software
is a little unpredictable about what it does with the rest of the
text. Like notes with spaces between each word.

I could also us a global setting for the other things like recieve
mode. I imported a list of air band freq's and they were all set to
FM. I had to manually set them to AM.

That's occasionally true. In my case my local RS had no clue so I faxed them all of the info for our local trunked system. You're right about the CB shop, that or a local HAM shop should be an excellent source for the local freq's.

Date: 1999-09-29 00:00:00 UTC
From: "Kyle D. Ross" <nothanks@nothankyou.com>
Message-ID: <7Prl3.2157$q91.160179@eagle.america.net>
Source record: 105869

Hello, fellow scanners...

I am very close to purchasing a Uniden BCT-12. This scanner has various 800MHz channels pre-programmed. I am curious about what happens when it finds a trunking control channel. Is it smart enough to skip it, or does it stop? The reason I can see this as a problem is that once a channel is locked out on the scanner, it can't be unlocked unless all locked-out channels are brought back.

I have a RS PRO-51 scanner for all other uses, but I don't monitor trunked systems much. It is my understanding that control channels change. So, I would assume that Uniden has no way of knowing which range of frequencies the control channel for any particular system would be, resulting in the control channel being a frequency that will be scanned.

If the scanner will stop on control channels, is it possible to lock-out only the 800MHz band on these scanners?

Could anyone recomend a good (small, cheap, controled via bc895) for the Uniden bc895. I already have a software recorder but I would like something that I could use while mobile.

Thanks,
Greg

Before you buy.

5287. Simple SMA connector from junk parts

Newsgroup: rec.radio.scanner
Date: 1999-09-29 00:00:00 UTC

Group,

This may not apply unless you fly model airplanes, but I just whipped up a simple male SMA connector out of stuff I had lying around on the workbench. I needed a single conductor (ie., center conductor only) for a longwire antenna, but a shield conductor could be added as well.

What I used were two nesting pieces of silicon tubing. The larger was a snug fit over the barrel of the radio connector, and was cut about twice as long as the barrel. The inner tubing was a piece of silicon fuel tubing, cut to about 50% the length of the larger tubing so that when nested, it was up against the top of the radio connector when flush with the outside of the larger tubing. The pin itself was a piece of capacitor lead wire soldered to a piece of stranded wire (actually a 12" clip lead). The pin and attached wire were a press fit into the center tubing. When assembled, the whole thing looks kinda like a silicon "F" connector. After assembly, the whole thing got a drop of thin CA (super glue for non-airplane types), which seems to have bonded everything together just fine. DON'T DO THIS WITH THE ASSEMBLY ON THE RADIO. CA is very capable of creeping into everything including the radio.

Works fine. I would imagine that you could add a shield conductor by running a wire down the inside of the larger tubing and hooking it back over the lower edge. Not the best for a clean RF connection, but in a pinch it works fine.

That actually sounds very interesting. What freq range are the ARTCC freqs,
and do they vary by area, or are they standard nation-wide? Also, if they
do vary by area, is there a site that comprehensively lists them by region?
On occasion I will sit by LAX (Los Angeles International Airport) and
monitor the incoming flights, and it is quite interesting.

To anyone who is into commercial air monitoring, what kinds of freqs do you
find the most interesting? (ie. AIRINC)

I can get it to import frequencies OK, but I so far have not gotten it
to obey other programmable parameters such as RX mode or tuning step
when these are included in the CSV file. The import routine
identifies them and associates the field with the parameter just fine.
However, the resulting imported frequencies seem to all default to FM
and not obey the RX mode.

Anyone know of an Email for RT systems?

Well, I still see it as another encroachment on our freedom. Don't get me wrong. Drug dealers and other criminals are scum. But the truth is that they will get caught in the act with or without a tap on their cell phone. Most of them are uneducated idiots.

But no, Uncle Sam must protect us from the evils of technology, right? "Better safe than sorry" how many times have you heard that said? I prefer the saying "those who sacrifice liberty for security deserve neither."

When are people going to figure out that you can't keep something 100% secure if you broadcast it at high power all over the area. I don't care what encryption you use - it's breakable. It HAS to be, or the intended recipient of your BROADCAST (that's what it is folks) wouldn't be able to decrypt it themselves! When no encryption is involved, well jeez man. You figure it out.

What we have here is a classic case of "Do as I say, not as I do." If I can't listen to cell phones, then the government whom I elected and whom I pay for shouldn't be able to either. Better yet, I should be able to monitor any part of the spectrum I want without fear of the "Men in black" visiting me.

Wait I know, let's ask Bill Cheek! Bill? Oh yeah... he's gone...

Think about it and then ask yourself again what business the government has in your radio room.

That is "red". "Pink" uses the same output but a different input frequency - that's the only difference. I think the input is 42.24? Not sure - it's been a while since I last looked it up.

>
>2.) Can somebody explain to me how the CHP extender system works?

The extenders operate on 154.905 and act like a mobile repeater for their handhelds. Remember the CHiP's detectors that used to be in the back of Popular Science and other mags? They worked by monitoring this frequency. When you hear activity on that frequency, it's a safe bet that there is a CHP officer nearby.

I found that when I could hear that signal loud and clear, I was within 1/4 mile of a CHP car. Doesn't always work though, as many officers are now hip to that trick and turn them off when they aren't in use.

Try 118.0-121.4, 123.6-128.8 & 132.025-135.975.

Probably the handiest source would be the "Airport/Facility Directory"
for your area (the US is covered in seven editions). This lists all the
details for every airport, including communication facilities. A section
in back lists each of the ARTCCs, with all of their remoted radio sites.
The A/FD can be bought for about $4 at any pilot supply shop or fixed
base operator at your local airport. It's revised every eight weeks, so
if you know a pilot you could ask him for the previous edition.

I have a Havis Shield made unit installed in my vehicles. There are
others out there such as Troy and Gamber Johnson.

I had these installed by a company in the San Francisco Area that is in
the business of installing all sort of police and fire communications
and lighting equipment. They have a contract to install emergency
equipment in all new San Francisco PD and other municipalities.

If you wish to further discuss this we can take it off line. I can also
take digital photos of the installation.

Since I'm in the two way business I got to write it off. These units are
not inexpensive, but they are really not out of line if you want a
professional installation.

Regards

Ed

last changed June 11, 1998

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)442-2425 or (817)870-5600, or through your local Radio Shack store

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A crystal scanner are not working and the lamps for those channels won't light, replace IC4 or IC5 (type 7400A).

library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Jan 1996 - Plectron & Motorola Alert Monitors
Feb 1996 - Radio Shack PRO-2042
Mar 1996 - Tips for Fixing Bearcat Scanners
May 1996 - Compendium of Scanner IFs
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters
Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)

Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500
Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T

hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using

green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts

of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great

searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses

custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact.

Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz

channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted

8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10

channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative

test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent

leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass,

AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz.

Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search

limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no

scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X		no	
FR105	6	X		no	
FR2512	24	X		no	
FR2513	24	X		no	
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been

replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard

or $34.95 for deluxe RadioMap report with histogram.
Include your name, address, and telephone number, along with
center location (nearest intersection of 2 streets, or
latitude & longitude) and mail to: Bob Parnass, 2350 Douglas
Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central
time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each,
but you must know the patent number. Credit card orders are
taken over the telephone by the Assistant Commissioner for
Patents at (703)305-4350. Alternatively, you can mail a
check or money order, made payable to "The Assistant
Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark
Office, call their automated information message system
toll-free at (800)786-9199.

There are various patent servers on the world wide web,
including IBM's server:

There are a few on eBay right now, going for a fraction of the "new" price. The older but similar BCT-10s are also going relatively cheaply.

Yes, in "Extender" mode it uses 154.905 TX/RX with a specific PL tone...and that is then repeatered at the vehicle to the dispatch center on 42 (or 39) MHz.

CHP uses & re-uses their freqs in various combinations throughout the state to reduce interference due to skip and low-band's generally "too good" propagation. Each combination has its own color name.

There's a list of CHP freqs and other stuff at the "SCANnorCAL" email list...take a peek at http://www.onelist.com/community/SCANnorCAL and join for a while if you like!

Thank you for your reply. That's comforting. I just ordered my BCT-12.
Can't wait to start using it.

What has been your experience with it? Good, bad, middle-of-the-road? Does
it distract you more than it helps (or entertains).

Does the Weather Alert function work well? That is one of the main features
I look forward to using.

>for my R2?

Already answered via email, but for the benefit of anyone else reading:

The programming cable I use is actually sold by Yaesu as part of the ADMS-1 kit intended for programming the FT-10/11/40/41/50/51/VX-1/-5. I already owned it. It appears to work perfectly with the IC-R2 as well. You use the main cable, with the 3-conductor plug on the end, without the 4-conductor adapter. (The IC-Q7 would likely use the adapter, but I don't have one of those).

The Icom software came from the same Icom dealer I got the radio from. Icom also sells a programming cable for the R2. I have heard someone say that the Yeasu cable works with Icom radios but not vice versa.

Damn fast (like @ 186,000 mps) if you've done something to get "their" attention, such as disrupting public safety, military or aircraft comms. Besides good old directing-finding, triangulation, etc., stuff like military-precision GPS, multi-freq monitoring/tracking, etc are available to folks like the FCC, FBI and their counterparts around the world.

I'd stick with the "not that I'm going to" and avoid a lot of grief. Not to mention getting somebody hurt if the wrong freq is interrupted at the wrong time. heart ,onitors, pacemakers, etc are all susceptible to radio interference. I wouldn't go there.

Yes I did read the question. Nextel phones and radios are the same devices.
They have a mode switch on the front panel which allows you to speak radio
to radio or via an interconnect to the public switched telephone network
(think of the latter as an autopatch).
They change from 6 to 1 multiplexing to 4 to 1 multiplexing which allows
better quality communications. (In my opinion from horrible to only
terrible). Sorry for the confusion.
The radio or phone name is only semantics.

Mark/W2MR

5321. Re: Question about Nextel radios

Source record: 105957
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Steve,

I should have used the word radio instead of phone in my response last night.

The Nextel radio or phone is the same device. They have a mode switch on the front panel which allows the user to switch from "radio to radio" to "phone" operation. When a phone call is made, the system changes from 6:1 multiplexing to 4:1 multiplexing providing better audio quality.

The system operates in the 860 MHz region, below the cellular band. Nextel bought up most of the old analog trunking channels that were popular in the 70's and 80's. They now have the eye on the old Geotek frequencies in the 900 MHz area. Geotek was a failed attempt to compete with Nextel.

Sorry for the confusion..let me know if I provide any more help.

Mark/W2MR

5324. F.S. Pro-60

Newsgroup: rec.radio.scanner
Date: 1999-09-29 00:00:00 UTC
From: David <dws@thezone.net>
Message-ID: <37F2CB20.90C1CAAD@thezone.net>
Source record: 105960

For Sale:
Pro 60 Radio Scanner
200 Channels
Freq. coverage: 30-512,760-824,849-869 &894-999.9875 mhz.

Price new at Radio Shack $399 Can.
Sale price as low as $299 Can.
Used ones offered on Scanner Newsgroups $150 U.S.

I am asking $170 Can. or $110 U.S.

Very MINOR cosmetic blemishes. I have Owners Manuel but no box.

For more info on this scanner check out the link below;

http://www.strongsignals.net/htm/pro-60.htm

Please E-mail me at DWS@THEZONE.NET

5325. SWAP: Toshiba Notebook PC - Scanner (certain models)

Newsgroup: rec.radio.scanner
Date: 1999-09-29 00:00:00 UTC
From: Kevin Gunning <brumey@ns.net>
Message-ID: <l9AI3.266$ea5.4501@dfw-read.news.verio.net>
Source record: 105961

All:
I have a Toshiba Satellite 410CDT color notebook computer for trade. For exact specification check out this link:

http://www.csd.toshiba.com/cgi-bin/WebObjects/Toshiba.woa/wa/showSSDetailedSpecs?productTypeId=1&productFamilyId=10&productSeriesId=191

The computer have only been used in a home environment and never mobile. First as my secondary PC then as my wife's email machine. It is in excellent condition both aesthetically and technically. In summary it is a Pentium 90 or 100,
40MB RAM and a 810MB hard disk. The unit has a built in CDROM drive, Active matrix screen, 28.8 PCMCIA modem and network card.

I am looking for one of the following scanners :
AOR 3000A
OPTOCOM
Base type Trunking Scanner (bearcat, can't remember model number)
Pro 2006 Preferably with Opto 456 board

Scanners must be good both cosmetically and
functionally.

Contact Kevin via email mailto:brumey@ns.net

Thanks.....

5326. Question: Sharing Discone Antenna?

Newsgroup: rec.radio.scanner
Date: 1999-09-29 00:00:00 UTC
From: Kevin Gunning <brumey@ns.net>
Message-ID: <RoAI3.273$ea5.4527@dfw-read.news.verio.net>
Source record: 105962

I am seeking expert opinion on the subject of sharing a discone receiving antennas. I have environmental limits that restrict my antenna toys. I recently acquired a 2nd scanner and possibly a 3rd soon. I would like to use the same antenna in a splitter type arrangement. I want to run all 2/3 scanners at the same time. Questions:
1) Can I do it?
2) If I can, will I compromise the signal strength?
3) Are there any solutions designed to solve my multi radio, one antenna dilemma.

Thanks in advance. Please respond via email and the group.

Kevin

Look at the specifications on the R.S. unit. If it meets your needs, buy
it. One thing Radio Shack does, is if you're not satisfied with a
product,
they'll cheerfully refund your money, as long as you have the receipt.
And their crap really does, in fact, meet the specs - it's just not
Hewlett-Packard stuff.

Cheers!
Rich

You're right about who made the scanner for Radio Shack. I happen to own one with the optional ctcss decoder board installed.
As far as mods go, it will depend on when the scanner was made. The earlier models were modifiable. As far as determining when your scanner was made, Uniden calls theres the "BC890xlt"

In addition a simple web search will usually do the trick. You can at least get started this way. I don't mind helping a newcomer but if I were in their shoes I would want the info right away. A simple visit to your favorite search engine will almost provide enough info yo get you going. Besides, when they ask I usually do a quick search and send them a few links from the results anyway.

Happy scanning!

Hello, folks!

I am new to the Atlanta area, and I'm trying to figure out some info about the GSP's radio frequencies and equipment. Specifically, I have read in other discussions that they are on SouthernLinc digital service now, yet I still get traffic on the normal frequencies. What's the story on this?

Also, if they are using analog equipment, do they use "mobile extenders"? I use a Uniden BCT-12 scanner in my vehicle, and it can sound an alarm if I am in the vicinity of a patrol car with a mobile extender that is in use.

Any information you may have will be greatly appreciated.

>'bow-tie' type antennas.

Not having seen one of these vans, I'm just guessing here...

That said, "low-emissions" doesn't mean "no-emissions." The earlier
posts about the local oscillator are correct. This is particularly
the case with older TVs because they all tended to use the same IF
transformers and the same LO frequencies.

It is true that one could also pick up the flyback signal. You should
know that such an antenna wouldn't be obvious. It would be a ferrite
loop antenna. It would be very easy to make a pair of crossed loops
with an ADF display to show when the flyback happened.

I use a similar antenna and radio direction finding mechanism in my
airplane. The antenna is a patch about 10 cm in diameter.

I have really enjoyed having it. I live in California and have never had an alert.

Other than that, my experience has been very favorable. I bought it from Uniden as a "reconditioned unit" about 3-4 years ago.

I travel quite a bit and usually have it on the combined highway patrol and local police setting. Don't have to enter channels it just obtains whatever is out there. Seamless. There is no utility in the highway patrol extender tones. By the time you hear them you are there. I have heard car to hq conversations of the HP -- but seldom.

I use the NEWS for local driving in the rush hour. I get to hear "all" of the local radio/TV remote traffic reports when they occur. Very useful and it has saved me a time or two. It is also amusing to hear the backroom chat between the reporters in the field and the newsrooms of a radio/TV station.

All in all, it was money well spent.

I think you will enjoy it.

Computers and other stuff do radiate noise and RF, but not on the specific
frequencies that a TV receiving a particular channel does. The tuner
has a local oscillator operating at a specific frequency to receive
a given channel, and a receiver tuned to that frequency can pick it
out even if it's far below the signals of other channels.

Here's an optical analogy: The local oscillator in a TV is a source
of almost pure single-frequency RF. In the optical world, the equivalent
would be a laser. Now, a low-power laser beam that is spread will
not be visible in daylight, because the white sunlight is much
stronger. But you can get very narrow-band optical filters that
let through an extremely narrow band of light frequencies - just a
few nm wide. If such a filter is centred on the laser frequency,
it will pass all the laser light - since the laser is a single
frequency. But the filter will reject about 99% of the light
from the sun, leaving only the 1% that is near the laser's
frequency. When you do this, the apparent brightness of the
sun is reduced by a factor of 100, and now the laser is brighter.

Radio receivers work in much the same way, except that their filters
can be *much* sharper than 1 part in 100.

Source record: 105907

Well, much to my surprise, my BCT-12 arrived at my doorstep today. I haven't had much time to play with it, but I made a short trip around town, and the alert function worked like a champ for me. Most times, I was a mile away from the source patrol car, which is plenty of time for me. I live in Georgia, so I guess the State Patrol makes good use of their in-car repeaters.

I was able to pick up the traffic reports on the scanner, too. What a great idea.

One question about the Weather Alert. Does it function in the same fashion as the HP alert? Will it sound the alarm and light up the lamp when a warning is issued? Will it change to the weather frequency so I can hear the warning? The manual doesn't do a god job of describing this feature.

I'm going to enjoy the heck out of this thing.

Thanks for your input!

>So am I correct in assuming that the handheld output freq is 154.905
>when using the extender and is then repeated on the extender to the
>regular CHP color coded channel?

In most cases yes. Think of it more along the lines of a extension to the in-car radio. A more accurate assumption is that the extender will repeat the comm's from the officer's handheld to whatever channel is tuned on the in-car radio. If they just ended a pursuit or a special detail for example, the extender will repeat to the "blue" frequency (42.34 or 39.18)
The extender also repeats traffic from the in-car radio BACK to the officer's hand held.

Whenever I cruise the California highways, I will lock onto the extender. If I hear something interesting, then a quick scan of the CHP frequencies tells me what freq they are on. Any other time, it's just a CHP detector for me.(Not that a Geo Metro can set any speed records or anything, but 55mph is a bit slow for me at times.)

your
>computer.

Not as big of a problem as you might think. If you know the protocol involved, ASTRO, for example then you just have the computer try all the different combinations involved until you see a valid frame sync sequence appear. Then process the protocol as normal.

For analog, the process is more difficult. But human speech has a distinctive waveform to it. A computer could try the different key combinations looking for a possible match on the waveform. Then it stores the probables for human verification later.

I didn't say it would be easy to do. But it's not impossible, regardless of what hype Motorola's marketing department tells you. Cracking DES encryption is no different than picking a lock on a door. If you have the right tools, it can be done.

5361. Two tone reader/decoder

Newsgroup: rec.radio.scanner
Date: 1999-09-30 00:00:00 UTC
From: nosmok1ng@aol.com
Message-ID: <19990930174634.09117.00000171@ng-fi1.aol.com>
Source record: 105910

Does anyone know if there is a (fairly inexpensive) tone decoder that I can attach to a scanner that will display the tone frequencies of a two tone paging encoder (Quick Call) as the tones are being transmitted? I just need something to display the tone frequecies not set off an alert.

Any help is greatly appreciated.

5362. Re: can radar detector's be modified

There was a story around the first of the year
about a police officer in Britain who got his radar gun
fried.
Seems a low flying military jet detected it as hostile and
the planes radar zapped it in the process of locking on for
missle launch. (missiles WERE NOT armed).

Look for a program called wintone.zip .. I am not sure it will
decode the tones you want but it is made to decode the subaudio and
telephone style tones from the scanner .

> Any way to detect the presence of a hidden transmiting device?

The device you seek is a near field receiver. Probably the best hobby grade product for this would be the Opto XPlorer, it will show you the frequency, PL tone, if any, and even let you HEAR the frequency you found, allowing instant bug detection. Pretty wide coverage too, it would find the average bug or walkie talkie in a hotel room easily.

Professionals counter surveillance guys use equipment that is 1000 times better than the Opto one, but most people I know don't have the kind of money it takes to get one of those units. The Opto goes for around 800 bucks.

I have a new "best" scanner and no longer use my pro 43. The pro 43 has
been modified. :) Great scanner. I am looking for a Yupiteru 9000. I
will trade or sell this scanner. Make me a offer.

Ron

Haven't tried Kracars but use Wacars......Can you hear the sound bursts? If not, there is a connection problem. If so, you may have to adjust audio until you start seeing results....even so,....
In Acars, make sure you are in "airmaster mode" (options/airmaster)
If logging while in Airnav make sure you go to "sourceData/live data from Wacars", then make sure you, when prompted, enter the correct " *.log " file. I find that sometimes the "log" file isn't present for opening until a minute or so...the log file is nothing more than a file named with the date and month in european format (ddmm).

From: iisergioii@aol.com
Message-ID: <19990929223728.04909.00000278@ng-fc1.aol.com>
Source record: 105970

"Damn fast (like @ 186,000 mps) if you've done something to get "their" attention, such as disrupting public safety, military or aircraft comms. Besides good old directing-finding, triangulation, etc., stuff like military-precision GPS, multi-freq monitoring/tracking, etc are available . . ."

First off anyone who intereferes w/a law enforcement frequency illegally is breaking the law as well as being an all-around assh*le.
Having said that, this post got me to wondering if walkie-talkies, simple FM or VHF room "bugs" etc. can be traced? Although certainly illegal in the US bugging a room with a walkie-talkie etc. could probably be done wantonly overseas. Who knows who's listening in when speaking in one's own hotel room outside of the USA, where such activity is specifically outlawed except when done by law enforcement and even then they need a court order I believe.
Any way to detect the presence of a hidden transmiting device?

I have posted a web page about the PDX (Portland International Airport) in Portland, Oregon.

You can find it at: http://www.spiritone.com/~noah/index.htm

You will find information of interest of Plane Spotters and Radio Scannists - for use at PDX. I have a page showing the airplanes you can spot at PDX, what radio frequencies to monitor while you are there, and a lot more information.

If you are an air travel hobbyist, a plane spotter or radio scannist - I hope you find the site interesting and informative.

hI group !

I got no luck with KRACARS or WaCars ?
I connect the audio output in the input or mic in (soundcard)
soundblaster.

Signal level is fine, and sometimes raw data pops out on the screen.
No acars massages whatsoever ?

What is the problem ?
I tryed it on desktop and laptop, no luck on both.

Do these progs suck ? like most other data decoding programs or is it
me ?

I'm in NY, acars on 131,55 flyes constantly with really good s-meter
too.

Thank YOu for you help :)

BTW. in AIRNAV program. When I press F3 to download data from the net
there is error msg saying , check my internet connection...
hmm, weird , anything else works fine on this connection other than
airnav.

What seems to be a problem there ?>

Thank You very much for you help on both manners.

If it were me??? I'd feed everything with 75ohm cable, and use
a TV amp and splitter. Well, at least the splitter. Instead of a TV
amp, you can buy wideband amps. Radio Shack even used to
sell them years ago just for scanners. If you have any local radio
or TV stations, you may have to put on traps.

5390. Icom IC-R2 vs. IC-Q7A??

Newsgroup: rec.radio.scanner
Date: 1999-09-30 00:00:00 UTC
From: nospam@leave.me.alone.com
Message-ID: <37f35cd9.1242954@news.eaglequest.com>
Source record: 105980

Now that I have my IC-R2, I find that it is nearly identical to the IC-Q7. From what I have seen in photos, even the insides look identical. Anyone know if they are indeed the same radio inside, with the transmit feature disabled? I note that the R2 version has repeater offsets as a "feature".

And while we're at it, why is the IC-Q7A less expensive than the R2? Do they perhaps leave out the rechargeable batteries and charger? Wish that were an option on the R2..... silly way to do rechargeables anyway.

It's about as rectangular as a shoe box (a little smaller) and about 1 1/2 inches high. You'll need a mini to mini patch cable and an RCA to sub-mini patch cable. I couldn't find RCA to sub-mini so I went RCA to mini woth a mini female to sub-mini male adapter.

Should be about $10 in cables and adapter.

The vans were real and their operation was real. PopComm published an article with photos some years ago. They vans operated on sound principal. The local oscillator in a television receiver emits a perceptible signal whose frequency can even be used to determine the channel being viewed. If you're curious about the strength of the oscillator emission, bring an AM radio near a TV set!

Good listening!

Interesting.

I wonder what use these so called detector vans are now that most TV's carry the CE marking, indicating they have little or no RF emissions. Surley computers and other digital items radiate more noise / RF than TV's do. Obviously TV's generate strong 15.625Khz and 50Hz (PAL/SECAM) signals but I would not think the van's pick this up, because they usually have 4 'bow-tie' type antennas.

Any ideas?
